# **PyFuncable Documentation**

***Release 1.2.0. (Blue Bontebok / Ladybug)***

**Nissar Chababy (@funilrys)**

**Apr 07, 2019**

---

## Contents

---

<b>1</b>	<b>What can PyFunceble do?</b>	<b>3</b>
<b>2</b>	<b>PyFunceble in action</b>	<b>5</b>
2.1	Domain testing . . . . .	5
2.2	URL testing . . . . .	5
2.3	Domain and URL testing with simple output . . . . .	5
2.4	File content testing . . . . .	5
2.5	File content testing with IDNA/Punycode conversion . . . . .	5
2.6	Generated files/outputs . . . . .	5
<b>3</b>	<b>Dead-Hosts as place to use PyFunceble!</b>	<b>7</b>
3.1	Why Dead-Hosts? . . . . .	7
3.2	How do Dead-Hosts work? . . . . .	7
3.3	History of Dead-Hosts . . . . .	7
<b>4</b>	<b>Installation</b>	<b>9</b>
4.1	Requirements . . . . .	9
4.1.1	Python 3.6+ . . . . .	9
4.1.2	colorama . . . . .	9
4.1.3	domain2idna . . . . .	10
4.1.4	PyYAML . . . . .	10
4.1.5	requests . . . . .	10
4.1.6	setuptools . . . . .	10
4.1.7	urllib3 . . . . .	10
4.2	Get PyFunceble . . . . .	10
4.2.1	Stable version . . . . .	10
4.2.2	Development version . . . . .	11
4.3	First steps . . . . .	12
<b>5</b>	<b>Update</b>	<b>13</b>
5.1	Stable version . . . . .	13
5.1.1	Using pip . . . . .	13
5.1.2	Using the AUR (for Arch Linux users) . . . . .	13
5.1.3	Pure Python method . . . . .	14
5.2	Development version . . . . .	14
5.2.1	For development . . . . .	14
5.2.2	For usage . . . . .	14

<b>6 Configuration</b>	<b>17</b>
6.1 Location . . . . .	17
6.1.1 Problematics . . . . .	17
6.1.2 Clone . . . . .	17
6.1.3 Travis CI . . . . .	17
6.1.4 Linux and MacOS (Darwin Kernel) . . . . .	18
6.1.5 Windows . . . . .	18
6.1.6 Custom location . . . . .	19
6.2 Autoconfiguration . . . . .	19
6.3 adblock . . . . .	19
6.4 auto_continue . . . . .	19

release v1.17.1

issues 3 open

PyFunceble is the little sister of [Funceble](#) which was archived on 13th March 2018.

Its main objective is to provide the availability of domains, IPs and since recently URL by generating an accurate result based on results from WHOIS, NSLOOKUP and HTTP status codes.

PyFunceble is currently running actively and daily with the help of Travis CI under 60+ repositories. It is used to clean or test the availability of data which are present in hosts files, list of IP, list of domains, block lists or even AdBlock filter lists.

PyFunceble provides some useful features for continuous testing.

As an example, its auto-continue system coupled with its auto-save system allows it to run nice and smoothly under Travis CI without even reaching Travis CI time restriction. In the other side, its internal inactive database system let `INACTIVE` and `INVALID` caught domains, IPs or URLs being automatically retested over time on next run.

# CHAPTER 1

---

## What can PyFunceble do?

---

- Test of the availability of a domain.
- Test of the availability of an IPv4.
- Test of the availability of an URL.
- Test of the availability of a domain/DNS name in a private or local network.
- Test of the availability of an IPv4 in a private or local network.
- Test of the availability of an URL in a private or local network.
- Test of the syntax of a domain.
- Test of the syntax of an IPv4.
- Test of the syntax of an URL.
- Test of domain or IP which are present into an Adblock formatted file.
- Test from a given raw link.
- Save test result(s) on file(s) (hosts file, plain text and/or JSON format).
- Show test result(s) on screen.
- Show percentage of each status (ACTIVE, INACTIVE, INVALID)
- Sort outputs hierarchically.
- “Mining” of domain or IP which are related to the tested element.
- Auto-continuation of tests in case of system crash or script stop.
- Filtering of a file content.
  - This feature will let us for example test all blogspot domain of the given file no matter the content of the file.
- Set the user-agent to use for the tests.

- Give some analytic depending of the HTTP status code (ACTIVE, POTENTIALLY\_ACTIVE, POTENTIALLY\_INACTIVE, SUSPICIOUS).
- Retest overtime of INACTIVE and INVALID domains.
- Print the execution time on screen and file.
- Customization of the different option via command-line arguments or configuration file.
- Continuous tests under Travis CI with the help of an auto saving and database system.
  - Set branch to push the result to for the autosaving system.
  - Set the minimal time before we autosave in order to avoid Travis CI limitation.
  - Set a command to execute at the end of the test.
  - Set the commit message for the autosaving system.
- ... and a lot more!

# CHAPTER 2

---

PyFunceble in action

---

## 2.1 Domain testing

## 2.2 URL testing

## 2.3 Domain and URL testing with simple output

## 2.4 File content testing

## 2.5 File content testing with IDNA/Punycode conversion

## 2.6 Generated files/outputs

# CHAPTER 3

---

## Dead-Hosts as place to use PyFunceble!

---

### 3.1 Why Dead-Hosts?

We are conscient that PyFunceble may run for days, that's why we offer you to request your list to be tested at Dead-Hosts.

### 3.2 How do Dead-Hosts work?

Dead-Hosts is like a wrapper of PyFunceble. Indeed, we use Travis CI containers in order to test lists with PyFunceble.

Once a list is set up inside our infrastructure, PyFunceble will test the list regularly and the Dead-Hosts infrastructure will produce a `clean.list` file which represents the list of domains/IP/URL which remains or became ACTIVE.

In addition, if needed, we can set up a list of GitHub username to @ping once a new test is finished.

### 3.3 History of Dead-Hosts

The project started on 3rd March 2017 at [funilrys/dead-hosts](https://github.com/funilrys/dead-hosts).

The original idea was to test `Funceble` against hosts file in order to find bugs inside `Funceble` but also letting me have a fewer long hosts file.

On 23rd January 2018, I (funilrys) decided to shut [funilrys/dead-hosts](https://github.com/funilrys/dead-hosts) down. Indeed, as it became impossible to test all members of the project without having to wait weeks, I decided that it was time to move to another level.

That was the beginning of `Dead-Hosts`.

Today `Dead-Hosts`'s objective is to provide to project/list maintainers or individuals - with the help of PyFunceble - more information about their favorite project/list or domains, IP or URL.

# CHAPTER 4

---

## Installation

---

### 4.1 Requirements

Here is the list of requirements:

- Python 3.6+
- colorama
- domain2idna
- PyYAML
- requests
- setuptools
- urllib3

#### 4.1.1 Python 3.6+

As we use for example

```
print('hello', end=' ')
```

which does not exist in Python 2.x and as I wanted to give a priority to Python 3, Python 3 is required.

#### 4.1.2 colorama

As we use some coloration coloration, colorama is required.

### 4.1.3 domain2idna

As we propose the conversion of domains to IDNA, domain2idna is required.

---

**Note:** domain2idna is maintained and developed by Nissar Chababy (@funilrys), the main developer of PyFunceble. Its source code can be found [on GitHub](#).

---

### 4.1.4 PyYAML

As our configuration file is written in `.yaml`, PyYAML is required.

### 4.1.5 requests

As we use `requests` when calling all `Lookup()` methods, `requests` is required.

### 4.1.6 setuptools

As we use `install_requires=xx` inside our `setup.py`, `setuptools` is required.

### 4.1.7 urllib3

You should normally already have it. But as we handle some of its errors while using `requests`, `urllib3` is required.

## 4.2 Get PyFunceble

### 4.2.1 Stable version

#### Using pip

Choose your repository, install and enjoy PyFunceble!

#### From PyPi

```
$ pip3 install PyFunceble
```

#### From GitHub

```
$ pip3 install git+https://github.com/funilrys/PyFunceble.git@master#egg=PyFunceble
```

#### Using the AUR (for Arch Linux users)

The package can be found at <https://aur.archlinux.org/packages/python-pyfunceble/>.

## With makepkg

```
$ wget https://aur.archlinux.org/cgit/aur.git/plain/PKGBUILD?h=python-pyfunceble  
$ makepkg  
$ sudo pacman -U python-pyfunceble*.tar.xz
```

## With your favorite AUR helper

**Warning:** We do not recommend any AUR helper but keep in mind that some AUR helpers are “better” than other. For more information about your current (or any other) AUR helper please report to [the ArchWiki page](#).

```
$ yourFavoriteAurHelper -S python-pyfunceble
```

## Pure Python method

Execute the following and enjoy PyFunceble!

```
$ git clone https://github.com/funilrys/PyFunceble.git  
$ cd PyFunceble  
$ python3 setup.py test && python3 setup.py install
```

## 4.2.2 Development version

The development version of PyFunceble represents the `dev` branch. It’s intended for the development of next features but is always at a usable state.

Indeed, We should not push to the `dev` branch until we are sure that the new commit does not break or introduce critical issue under PyFunceble.

### For development

Execute the following and let’s hack PyFunceble!

---

**Note:** We highly recommend you to develop PyFunceble under a `virtualenv`.

---

```
$ git clone https://github.com/funilrys/PyFunceble.git  
$ cd PyFunceble && git checkout dev && virtualenv venv  
$ source venv/bin/activate && pip3 install -e .
```

---

**Note:** After installing with:

```
$ source venv/bin/activate && pip3 install -e .
```

- you only need to update the repository.
  - you don’t have to rerun the `pip` command.
-

## For usage

### Using pip

Execute one of the following and enjoy PyFunceble!

#### From PyPi

```
$ pip3 install PyFunceble-dev
```

#### From GitHub

```
$ pip3 install git+https://github.com/funilrys/PyFunceble.git@dev#egg=PyFunceble
```

### Using the AUR (for Arch Linux users)

The package can be found at <https://aur.archlinux.org/packages/python-pyfunceble-dev/>.

#### With makepkg

```
$ wget https://aur.archlinux.org/cgit/aur.git/plain/PKGBUILD?h=python-pyfunceble-dev
$ makepkg
$ sudo pacman -U python-pyfunceble-dev*.tar.xz
```

#### With your favorite AUR helper

**Warning:** We do not recommend any AUR helper but keep in mind that some AUR helpers are “better” than other. For more information about your current (or any other) AUR helper please report to [the ArchWiki page](#).

```
$ yourFavoriteAurHelper -S python-pyfunceble-dev
```

### Pure Python method

Execute the following and enjoy PyFunceble!

```
$ git clone https://github.com/funilrys/PyFunceble.git
$ cd PyFunceble && git checkout dev
$ python3 setup.py test && python3 setup.py install
```

## 4.3 First steps

Make sure that you can run

```
$ PyFunceble --version
```

and enjoy PyFunceble!!

# CHAPTER 5

---

Update

---

## 5.1 Stable version

### 5.1.1 Using pip

Choose your repository, install and enjoy PyFunceble!

#### From PyPi

```
$ pip3 install --upgrade PyFunceble
```

#### From GitHub

```
$ pip3 install --upgrade git+https://github.com/funilrys/PyFunceble.git@master  
→#egg=PyFunceble
```

### 5.1.2 Using the AUR (for Arch Linux users)

#### With makepkg

```
$ wget https://aur.archlinux.org/cgit/aur.git/plain/PKGBUILD?h=python-pyfunceble  
$ makepkg  
$ sudo pacman -U python-pyfunceble*.tar.xz
```

## With your favorite AUR helper

**Warning:** We do not recommend any AUR helper but keep in mind that some AUR helpers are “better” than other. For more information about your current (or any other) AUR helper please report to [the ArchWiki page](#).

```
$ yourFavoriteAurHelper -Syu python-pyfuncable
```

### 5.1.3 Pure Python method

Execute the following and enjoy PyFunceble!

```
$ cd PyFunceble
$ git checkout master && git fetch origin && git merge origin/master
$ python3 setup.py test && python3 setup.py install
```

## 5.2 Development version

### 5.2.1 For development

```
$ cd PyFunceble && git checkout dev
$ git fetch origin && git merge origin/dev
```

---

**Note:** As you previously installed with

```
$ . venv/bin/activate && pip3 install -e .
```

---

Only code/repository update is required.

---

### 5.2.2 For usage

#### Using pip

Execute one of the following and enjoy PyFunceble!

##### From PyPi

```
$ pip3 install --upgrade PyFunceble-dev
```

##### From GitHub

```
$ pip3 install --upgrade git+https://github.com/funilrys/PyFunceble.git@dev
↪#egg=PyFunceble
```

## Using the AUR (for Arch Linux users)

### With makepkg

```
$ wget https://aur.archlinux.org/cgit/aur.git/plain/PKGBUILD?h=python-pyfunceble-dev
$ makepkg
$ sudo pacman -U python-pyfunceble-dev*.tar.xz
```

### With your favorite AUR helper

**Warning:** We do not recommend any AUR helper but keep in mind that some AUR helpers are “better” than other. For more information about your current (or any other) AUR helper please report to [the ArchWiki page](#).

```
$ yourFavoriteAurHelper -Syu python-pyfunceble-dev
```

### Pure Python method

Execute the following and enjoy PyFunceble!

```
$ cd PyFunceble && git checkout dev
$ git fetch origin && git merge origin/dev
$ python3 setup.py test && python3 setup.py install
```

# CHAPTER 6

---

## Configuration

---

This page will try to detail each configuration available into `.PyFunceble.yaml` along with the location of where we are looking for the configuration file.

### 6.1 Location

#### 6.1.1 Problematics

- How can we create a more efficient way to work with configuration?
- How can we make the configuration file(s) available globally so that PyFunceble can be run everywhere in the user workspace?

To answer those problematics, we moved the configuration location elsewhere in the place where most users expect to have their configuration file(s).

#### 6.1.2 Clone

If you cloned the repository and you're trying to test from a cloned directory (the one with for example `CONTRIBUTING.md`) we consider the configuration directory as the current one.

---

**Note:** This behavior allows us to not modify the way we develop PyFunceble.

---

#### 6.1.3 Travis CI

Under [Travis CI](#), we search or initiate the configuration at the directory we are currently located.

**Warning:** We don't care about the distribution, as long as the TRAVIS\_BUILD\_DIR environment variable is set, we search or initiate the configuration in the current directory.

---

**Note:** If you want to force the directory where we should work, you can initiate the PYFUNCEBLE\_OUTPUT\_DIR environment variable with the path where we should work.

---

### 6.1.4 Linux and MacOS (Darwin Kernel)

Under Linux and MacOS, we look for the following directories in their order. If any configuration directory is found, the system proposes you to install them automatically on the first configuration file.

1. `~/.config/PyFunceble`
2. `~/.PyFunceble`
3. `$(PWD)`

---

**Note:** If the parent directory does not exist, we move to the next possible location in the given order.

This means that under most Linux distributions and MacOS versions, we consider `~/.config/PyFunceble` as the configuration location. But if the `~/.config` directory does not exist, we fallback to `~/.PyFunceble` as the configuration location.

---

### 6.1.5 Windows

As mentioned by [Pat Altimore's Blog](#), we used the Per user configuration files synchronized across domain joined machines via Active Directory Roaming section in order to understand what we should do to find our configuration directory.

Under Windows, we look for the following directories in their order. If any configuration directory is found, the system proposes you to install them automatically on the first configuration file.

1. `%APPDATA%\PyFunceble` (environnement variable)
2. `%CD%`

---

**Note:** `%CD%` is explained by the set command (`set /?`):

---

`%CD%` – expands to the current directory string.

---

---

**Note:** If the parent directory does not exist, we move to the next possible location in the given order.

This means that under most Windows versions, we consider `%APPDATA%\PyFunceble` - also known as `C:\Users\userName\AppData\Roaming\PyFunceble`- as the configuration location. But if the `%APPDATA%` directory does not exist, we fall back to the current directory as the configuration location.

---

### 6.1.6 Custom location

Sometimes, you may find yourself in a position where you absolutely do not want PyFunceble to use its default configuration location.

For that reason, if you set your desired configuration location along with the PYFUNCEBLE\_OUTPUT\_DIR environment variable, we take that location as the (default) configuration location.

## 6.2 Autoconfiguration

Sometimes, you may find yourself in a position that you do not or you can't answer the question which asks you if you would like to install the default configuration file.

For that reason, if you set PYFUNCEBLE\_AUTO\_CONFIGURATION as an environment variable with what you want an assignment, we do not ask that question. We simply do what we have to do without asking anything.

## 6.3 adblock

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the adblock format decoding.

---

**Note:** If this index is set to True, every time we read a given file, we try to extract the elements that are present.

We basically only decode the adblock format.

---

---

**Note:** If this index is set to False, every time we read a given file, we will consider one line as an element to test.

---

## 6.4 auto\_continue

**Type:** boolean

**Default value:** True

**Description:** Enable / disable the auto continue system.

## 6.5 command

**Type:** string

**Default value:** ""

**Description:** Set the command to run before each commit (except the final one).

---

**Note:** The parsed command is called only if auto\_continue and travis are set to True.

---

## 6.6 `command_before_end`

**Type:** string

**Default value:** ""

**Description:** Set the command to run before the final commit.

---

**Note:** The parsed command is called only if `auto_continue` and `travis` are set to True.

---

**Note:** Understand by final commit the commit which will deliver the last element we have to test.

---

## 6.7 `custom_ip`

**Type:** string

**Default value:** "0.0.0.0"

**Description:** Set the custom IP to use when we generate a line in the hosts file format.

---

**Note:** This index has no effect if `generate_hosts` is set to False.

---

## 6.8 `days_between_db_retest`

**Type:** integer

**Default value:** 1

**Description:** Set the number of day(s) between each retest of the `INACTIVE` and `INVALID` elements which are present into `inactive_db.json`.

---

**Note:** This index has no effect if `inactive_database` is set to False.

---

## 6.9 `debug`

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the generation of debug file(s).

---

**Note:** This index has no effect if `logs` is set to False

---

**Warning:** Do not touch this index unless you have a good reason to.

**Warning:** Do not touch this index unless you have been invited to.

## 6.10 filter

**Type:** string

**Default value:** ""

**Description:** Set the element to filter.

---

**Note:** This index should be initiated with a regular expression.

---

## 6.11 generate\_hosts

**Type:** boolean

**Default value:** True

**Description:** Enable / disable the generation of the hosts file(s).

## 6.12 generate\_json

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the generation of the JSON file(s).

## 6.13 header\_printed

**Type:** boolean

**Default value:** False

**Description:** Say to the system if the header has been already printed or not.

**Warning:** Do not touch this index unless you have a good reason to.

## 6.14 hierarchical\_sorting

**Type:** boolean

**Default value:** False

**Description:** Say to the system if we have to sort the list and the outputs in a hierarchical order.

## 6.15 iana\_whois\_server

**Type:** string

**Default value:** whois.iana.org

**Description:** Set the server to call to get the whois referer of a given element.

---

**Note:** This index is only used when generating the iana-domains-db.json file.

---

**Warning:** Do not touch this index unless you have a good reason to.

## 6.16 idna\_conversion

**Type:** boolean

**Default value:** False

**Description:** Tell the system to convert all domains to IDNA before testing.

---

**Note:** We use domain2idna for the conversion.

---

## 6.17 inactive\_database

**Type:** boolean

**Default value:** True

**Description:** Enable / Disable the usage of a database to store the INACTIVE and INVALID element to retest overtime.

## 6.18 less

**Type:** boolean

**Default value:** True

**Description:** Enable / Disable the output of every information of screen.

## 6.19 local

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the execution of the test(s) in a local or private network.

## 6.20 logs

**Type:** boolean

**Default value:** True

**Description:** Enable / Disable the output of all logs.

## 6.21 mining

**Type:** boolean

**Default value:** True

**Description:** Enable / Disable the mining subsystem.

## 6.22 no\_files

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the generation of any file(s).

## 6.23 no\_whois

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the usage of whois in the tests.

## 6.24 plain\_list\_domain

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the generation of the plain list of elements sorted by statuses.

**Warning:** Do not touch this index unless you have a good reason to.

## 6.25 quiet

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the generation of output on the screen.

## 6.26 referer

**Type:** string

**Default value:** ""

**Description:** Set the referer of the element that is currently under test.

**Warning:** Do not touch this index unless you have a good reason to.

## 6.27 seconds\_before\_http\_timeout

**Type:** integer

**Default value:** 3

**Description:** Set the timeout to apply to every HTTP status code request.

---

**Note:** This index must be a multiple of 3.

---

## 6.28 share\_logs

**Type:** boolean

**Default value:** True

**Description:** Enable / disable the logs sharing.

---

**Note:** This index has no effect if logs is set to False.

---

## 6.29 show\_execution\_time

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the output of the execution time.

## 6.30 show\_percentage

**Type:** boolean

**Default value:** True

**Description:** Enable / disable the output of the percentage of each status.

## 6.31 simple

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the simple output mode.

---

**Note:** If this index is set to True, the system will only return the result in format: tested.element STATUS.

---

## 6.32 split

**Type:** boolean

**Default value:** True

**Description:** Enable / disable the split of the results files.

---

**Note:** Understand with “results files” the mirror of what is shown on screen.

---

## 6.33 syntax

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the syntax (only) testing.

**Warning:** If this index is set to True, we **ONLY** check for syntax, not availability.

## 6.34 travis

**Type:** boolean

**Default value:** False

**Description:** Enable / disable the Travis CI autosaving system.

**Warning:** Do not activate this index unless you are using PyFunceble under Travis CI.

## 6.35 travis\_autosave\_commit

**Type:** string

**Default value:** "PyFunceble - AutoSave"

**Description:** Set the default commit message we want to use when have to commit (save) but our tests are not yet completed.

## 6.36 travis\_autosave\_final\_commit

**Type:** string

**Default value:** "PyFunceble - Results"

**Description:** Set the default final commit message we want to use when we all tests are finished.

## 6.37 travis\_autosave\_minutes

**Type:** integer

**Default value:** 15

**Description:** Set the minimum of minutes we have to run before to automatically save our test results.

---

**Note:** As many services are setting a rate limit per IP, it's a good idea to set this value between 1 and 15 minutes.

---

## 6.38 travis\_branch

**Type:** string

**Default value:** master

**Description:** Set the git branch where we are going to push our results.

## 6.39 unified

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the generation of the unified results.

---

**Note:** This index has no effect if split is set to True.

---

## 6.40 user\_agent

**Type:** string

**Default value:** "Mozilla/5.0 (X11; Linux x86\_64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/67.0.3396.99 Safari/537.36"

**Description:** Set the User-Agent to use every time we are requesting something from a web server other than our API.

## 6.41 verify\_ssl\_certificate

**Type:** boolean

**Default value:** False

**Description:** Enable / Disable the verification of the SSL/TLS certificate when testing for URL.

**Warning:** If you set this index to True, you may get **false positive** result.

Indeed if the certificate is not registered to the CA or is simply invalid and the domain is still alive, you will always get INACTIVE as output.

## 6.42 whois\_database

**Type:** boolean

**Default value:** True

**Description:** Enable / Disable the usage of the whois database to avoid/bypass whois server requests rate limit.

## 6.43 outputs

**Type:** dict

**Description:** Set the needed output tree/names.

**Warning:** If you choose to change anything please consider deleting our output/ directory and the dir\_structure\*.json files.

### 6.43.1 outputs[default\_files]

**Type:** dict

**Description:** Set the default name of some important files.

`outputs[default_files][dir_structure]`

**Type:** string

**Default value:** dir\_structure.json

**Description:** Set the default filename of the file which has the structure to re-construct.

---

**Note:** This index has no influence with dir\_structure\_production.json

---

`outputs[default_files][iana]`

**Type:** string

**Default value:** iana-domains-db.json

**Description:** Set the default filename of the file which has the formatted copy of the IANA root zone database.

`outputs[default_files][inactive_db]`

**Type:** string

**Default value:** inactive\_db.json

**Description:** Set the default filename of the file which will save the list of elements to retest overtime.

`outputs[default_files][results]`

**Type:** string

**Default value:** results.txt

**Description:** Set the default filename of the file which will save the formatted copy of the public suffix database.

`outputs[default_files][public_suffix]`

**Type:** string

**Default value:** public-suffix.json

**Description:** Set the default filename of the file which will save the mirror of what is shown on screen.

## 6.43.2 `outputs[domains]`

**Type:** dict

**Description:** Set the default name of some important files related to the plain\_list\_domain index.

`outputs[domains][directory]`

**Type:** string

**Default value:** domains/

**Description:** Set the default directory where we have to save the plain list of elements for each status.

`outputs[domains][filename]`

**Type:** string

**Default value:** list

**Description:** Set the default filename of the file which will save the plain list of elements.

### 6.43.3 outputs[hosts]

**Type:** dict

**Description:** Set the default name of some important files related to the generate\_hosts index.

`outputs[hosts][directory]`

**Type:** string

**Default value:** hosts/

**Description:** Set the default directory where we have to save the hosts files of the elements for each status.

`outputs[hosts][filename]`

**Type:** string

**Default value:** hosts

**Description:** Set the default filename of the file which will save the hosts files of the elements.

### 6.43.4 outputs[json]

**Type:** dict

**Description:** Set the default name of some important files related to the generate\_json index.

`outputs[json][directory]`

**Type:** string

**Default value:** json/

**Description:** Set the default directory where we have to save the JSON files of the elements for each status.

`outputs[json][filename]`

**Type:** string

**Default value:** dump.json

**Description:** Set the default filename of the file which will save the JSON files of the elements.

### 6.43.5 `outputs[analytic]`

**Type:** dict

**Description:** Set the default name of some important files and directories related to the generate\_hosts index.

`outputs[analytic][directories]`

**Type:** dict

**Description:** Set the default name of some important directories related to the http\_codes[active] index.

`outputs[analytic][directories][parent]`

**Type:** string

**Default value:** Analytic/

**Description:** Set the default directory where we are going to put everything related to the HTTP analytic.

`outputs[analytic][directories][potentially_down]`

**Type:** string

**Default value:** POTENTIALLY\_INACTIVE/

**Description:** Set the default directory where we are going to put all potentially inactive data.

`outputs[analytic][directories][potentially_up]`

**Type:** string

**Default value:** POTENTIALLY\_INACTIVE/

**Description:** Set the default directory where we are going to put all potentially active data.

`outputs[analytic][directories][up]`

**Type:** string

**Default value:** POTENTIALLY\_INACTIVE/

**Description:** Set the default directory where we are going to put all active data.

`outputs[analytic][directories][suspicious]`

**Type:** string

**Default value:** SUSPICIOUS/

**Description:** Set the default directory where we are going to put all suspicious data.

`outputs[analytic][filenames]`

**Type:** dict

**Description:** Set the default name of some important files related to the `http_codes[active]` index and the HTTP analytic subsystem.

`outputs[analytic][filenames][potentially_down]`

**Type:** string

**Default value:** down\_or\_potentially\_down

**Description:** Set the default filename where we are going to put all potentially inactive data.

`outputs[analytic][filenames][potentially_up]`

**Type:** string

**Default value:** potentially\_up

**Description:** Set the default filename where we are going to put all potentially active data.

`outputs[analytic][filenames][up]`

**Type:** string

**Default value:** active\_and\_merged\_in\_results

**Description:** Set the default filename where we are going to put all active data.

`outputs[analytic][filenames][suspicious]`

**Type:** string

**Default value:** suspicious\_and\_merged\_in\_results

**Description:** Set the default filename where we are going to put all suspicious data.

## 6.43.6 outputs[logs]

**Type:** dict

**Description:** Set the default name of some important files and directories related to the `logs` index.

`outputs[logs][directories]`

**Type:** dict

**Description:** Set the default name of some important directories related to the logs index.

`outputs[logs][directories][date_format]`

**Type:** string

**Default value:** date\_format/

**Description:** Set the default directory where we are going to put everything related to the data when the dates are in the wrong format.

`outputs[logs][directories][no_referer]`

**Type:** string

**Default value:** no\_referer/

**Description:** Set the default directory where we are going to put everything related to the data when no referer is found.

`outputs[logs][directories][parent]`

**Type:** string

**Default value:** no\_referer/

**Description:** Set the default directory where we are going to put everything related to the data when no referer is found.

`outputs[logs][directories][percentage]`

**Type:** string

**Default value:** percentage/

**Description:** Set the default directory where we are going to put everything related to percentages.

`outputs[logs][directories][whois]`

**Type:** string

**Default value:** whois/

**Description:** Set the default directory where we are going to put everything related to whois data.

---

**Note:** This is the location of all files when the debug index is set to True.

---

`outputs[logs][filenames]`

**Type:** dict

**Description:** Set the default filenames of some important files related to the logs index.

`outputs[logs][filenames][auto_continue]`

**Type:** string

**Default value:** continue.json

**Description:** Set the default filename where we are going to put the data related to the auto continue subsystem.

---

**Note:** This file is allocated if the `auto_continue` is set to True.

---

`outputs[logs][filenames][execution_time]`

**Type:** string

**Default value:** execution.log

**Description:** Set the default filename where we are going to put the data related to the execution time.

---

**Note:** This file is allocated if the `show_execution_time` is set to True.

---

`outputs[logs][filenames][percentage]`

**Type:** string

**Default value:** percentage.txt

**Description:** Set the default filename where we are going to put the data related to the percentage.

---

**Note:** This file is allocated if the `show_percentage` is set to True.

---

#### 6.43.7 `outputs[main]`

**Type:** string

**Default value:** ""

**Description:** Set the default location where we have to generate the `parent_directory` directory and its dependencies.

#### 6.43.8 outputs [parent\_directory]

**Type:** string

**Default value:** output/

**Description:** Set the directory name of the parent directory which will contain all previously nouns directories.

#### 6.43.9 outputs [splited]

**Type:** dict

**Description:** Set the default name of some important files and directory related to the split index.

##### outputs [splited] [directory]

**Type:** string

**Default value:** splited/

**Description:** Set the default directory name where we are going to put the split data.

### 6.44 status

**Type:** dict

**Description:** Set the needed, accepted and status name.

#### 6.44.1 status [list]

**Type:** dict

**Description:** Set the needed and accepted status name.

**Warning:** All status should be in lowercase.

##### status [list] [valid]

**Type:** list

**Default value:** ["valid", "syntax\_valid", "valid\_syntax"]

**Description:** Set the accepted VALID status.

---

**Note:** This status is only shown if the syntax index is activated.

---

`status[list][up]`

**Type:** list

**Default value:** ["up", "active"]

**Description:** Set the accepted ACTIVE status.

`status[list][generic]`

**Type:** list

**Default value:** ["generic"]

**Description:** Set the accepted generic status.

---

**Note:** This status is the one used to say the system that we have to print the complete information on the screen.

---

`status[list][http_active]`

**Type:** list

**Default value:** ["http\_active"]

**Description:** Set the accepted status for the outputs[analytic][filenames][up] index.

`status[list][down]`

**Type:** list

**Default value:** ["down", "inactive", "error"]

**Description:** Set the accepted status INACTIVE index.

`status[list][invalid]`

**Type:** list

**Default value:** ["ouch", "invalid"]

**Description:** Set the accepted status INVALID index.

`status[list][potentially_down]`

**Type:** list

**Default value:** ["potentially\_down", "potentially\_inactive"]

**Description:** Set the accepted status for the outputs[analytic][filenames][potentially\_down] index.

`status[list][potentially_up]`

**Type:** list

**Default value:** ["potentially\_up", "potentially\_active"]

**Description:** Set the accepted status for the outputs [analytic] [filenames] [potentially\_up] index.

`status[list][suspicious]`

**Type:** list

**Default value:** ["strange", "hum", "suspicious"]

**Description:** Set the accepted status for the outputs [analytic] [filenames] [suspicious] index.

#### 6.44.2 `status[official]`

**Type:** dict

**Description:** Set the official status name.

---

**Note:** Those status are the ones that are printed on the screen.

---

**Warning:** After any changes here please delete `dir_structure.json` and the `output/` directory.

`status[official][up]`

**Type:** string

**Default value:** ACTIVE

**Description:** Set the returned status for the ACTIVE case.

`status[official][down]`

**Type:** string

**Default value:** INACTIVE

**Description:** Set the returned status for the INACTIVE case.

`status[official][invalid]`

**Type:** string

**Default value:** INVALID

**Description:** Set the returned status for the INVALID case.

`status[official][valid]`

**Type:** string

**Default value:** VALID

**Description:** Set the returned status for the VALID case.

---

**Note:** This status is only shown if the syntax index is activated.

---

## 6.45 http\_codes

**Type:** dict

**Description:** Handle the interpretation of each status codes when we do and generate our analytic data.

### 6.45.1 http\_codes[active]

**Type:** boolean

**Default value:** True

**Description:** Enable / Disable the usage of the HTTP status code extraction.

### 6.45.2 http\_codes[list]

**Type:** dict

**Description:** Categorize the http status code as mentioned in the documentation related to the HTTP Code column.

`http_codes[list][up]`

**Type:** list

**Default value:**

```
- 100
- 101
- 200
- 201
- 202
- 203
- 204
- 205
- 206
```

**Description:** List the HTTP status codes which are considered as ACTIVE.

`http_codes[list][potentially_down]`

**Type:** list

**Default value:**

```
- 400
- 402
- 403
- 404
- 409
- 410
- 412
- 414
- 415
- 416
```

**Description:** List the HTTP status code which are considered as INACTIVE or POTENTIALLY\_INACTIVE.

`http_codes[list][potentially_up]`

**Type:** list

**Default value:**

```
- 000
- 300
- 301
- 302
- 303
- 304
- 305
- 307
- 403
- 405
- 406
- 407
- 408
- 411
- 413
- 417
- 500
- 501
- 502
- 503
- 504
- 505
```

**Description:** List the HTTP status code which are considered as ACTIVE or POTENTIALLY\_ACTIVE.

## 6.46 links

**Type:** dict

**Description:** Set the list of links which can be used/called by the system when needed.

---

**Note:** The objective of this index is to avoid hardcoded links when the configuration file is readable.

---

#### 6.46.1 `links[api_date_format]`

**Type:** string

**Default value:** <https://pyfuncable.funilrys.com/api/date-format>

**Description:** Set the link to use when we share logs.

#### 6.46.2 `links[api_no_referer]`

**Type:** string

**Default value:** <https://pyfuncable.funilrys.com/api/no-referer>

**Description:** Set the link to use when we share logs.

#### 6.46.3 `links[config]`

**Type:** string

**Default value:** [https://raw.githubusercontent.com/funilrys/PyFunceble/master/.PyFunceble\\_production.yaml](https://raw.githubusercontent.com/funilrys/PyFunceble/master/.PyFunceble_production.yaml)

**Description:** Set the upstream link to the configuration file.

#### 6.46.4 `links[dir_structure]`

**Type:** string

**Default value:** [https://raw.githubusercontent.com/funilrys/PyFunceble/master/dir\\_structure\\_production.json](https://raw.githubusercontent.com/funilrys/PyFunceble/master/dir_structure_production.json)

**Description:** Set the upstream link to the directory structure dump file.

#### 6.46.5 `links[iana]`

**Type:** string

**Default value:** <https://raw.githubusercontent.com/funilrys/PyFunceble/master/iana-domains-db.json>

**Description:** Set the upstream link to the IANA zone file configuration file.

#### 6.46.6 `links[repo]`

**Type:** string

**Default value:** <https://github.com/funilrys/PyFunceble>

**Description:** Set the upstream link to the repository.

### 6.46.7 links [requirements]

**Type:** string

**Default value:** https://raw.githubusercontent.com/funilrys/PyFunceble/master/requirements.txt

**Description:** Set the upstream link to the requirements.txt file.

### 6.46.8 links [psl]

**Type:** string

**Default value:** https://raw.githubusercontent.com/funilrys/PyFunceble/master/public-suffix.json

**Description:** Set the upstream link to the public suffix database file.

## 6.47 counter

**Type:** dict

**Description:** Setup the internal counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

### 6.47.1 counter [number]

**Type:** dict

**Description:** Setup the internal counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

### counter [number] [down]

**Type:** integer

**Default value:** 0

**Description:** Setup the internal down counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

`counter[number] [invalid]`

**Type:** integer

**Default value:** 0

**Description:** Setup the internal invalid counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

`counter[number] [tested]`

**Type:** integer

**Default value:** 0

**Description:** Setup the internal tested counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

`counter[number] [up]`

**Type:** integer

**Default value:** 0

**Description:** Setup the internal up counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

## 6.47.2 `counter[percentage]`

**Type:** dict

**Description:** Setup the internal percentage counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

`counter[percentage] [down]`

**Type:** integer

**Default value:** 0

**Description:** Setup the internal down percentage counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

`counter[percentage] [invalid]`

**Type:** integer

**Default value:** 0

**Description:** Setup the internal invalid percentage counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

`counter[percentage] [up]`

**Type:** integer

**Default value:** 0

**Description:** Setup the internal up percentage counter.

**Warning:** The following is not intended for modification. Exception for debugging or special cases which requires an initiated counter.

# CHAPTER 7

---

## Usage

---

### 7.1 From a terminal

#### 7.1.1 Detailed

---

**Note:** False stand for deactivated when True stand for activated.

---

##### **-ad | --adblock**

Switch the decoding of the adblock format.

**Default value:** False

If this argument is activated the system will extract all domains or IP from the given adblock file.

##### **-a | --all**

Output all available information on the screen.

**Default value:** False

**When activated:**

Domain	Status	Expiration Date	Source	HTTP Code	⋮
pyfuncable.readthedocs.io	ACTIVE	Unknown	NSLOOKUP	302	⋮
					⋮

**When deactivated:**

Domain	Status	HTTP Code	
pyfunceble.readthedocs.io	ACTIVE	302	<a href="#">Link</a>
			<a href="#">Link</a>

### `-c | --auto-continue | --continue`

Switch the value of the auto continue mode.

**Default value:** True

This argument activates or deactivates the auto-continue subsystem. Indeed, as we can automatically continue if the script has been stopped, this switch allows us to disable or enable the usage of that specific subsystem.

### `--clean`

Clean all files under output.

As it is sometimes needed to clean our `output` / directory, this argument does the job automatically.

**Warning:** This argument delete everything which are `.keep` or `.gitignore`

### `--clean-all`

Clean all files under output and all file generated by PyFunceble.

**Warning:** This really deletes everything we generated without any warning.

### `--cmd "something"`

Pass a command before each commit (except the final one).

**Default value:** ''

---

**Note:** In this example, `something` should be a script or a program which have to be executed when we reached the end of the given file.

---

**Note:** This argument is only used if `--travis` or `travis : true` (under `.PyFunceble.yaml`) are activated.

---

### `--cmd-before-end "something"`

Pass a command before the results (final) commit under the Travis mode.

**Default value:** ''

---

**Note:** In this example, something should be a script or a program which have to be executed when we reached the end of the given file.

---

---

**Note:** This argument is only used if --travis or travis : true (under .PyFunceble.yaml) are activated.

---

**--commit-autosave-message "something"**

Replace the default autosave commit message.

**Default value:** PyFunceble - AutoSave

This argument allows us to set a custom commit message which is going to be used as commit message when saving.

---

**Note:** This argument is only used if --travis or travis : true (under .PyFunceble.yaml) are used.

---

---

**Note:** This argument is only used if we have to split the work into multiple processes because a list is too long or the timeout is reached.

---

**Warning:** Please avoid the usage of [ci skip] here.

**--commit-results-message "something"**

Replace the default results (final) commit message.

**Default value:** PyFunceble - Results

---

**Note:** This argument is only used if --travis or travis : true (under .PyFunceble.yaml) are used.

---

---

**Note:** This argument is only used if we reached the end of the list we are or have to test.

---

**-d "something" | --domain "something"**

Set and test the given domain.

This argument will test and give the results of the tests of the given domain.

---

**Note:** For this argument (and only for this argument), we are converting the given string to lowercase.

---

**-db | --database**

Switch the value of the usage of a database to store inactive domains of the currently tested list.

**Default value:** True

This argument will disable or enable the usage of a database which saves all *INACTIVE* and *INVALID* domain of the given file over time.

---

**Note:** The database is retested every x day(s), where x is the number set in `-dbr "something"`.

---

**-dbr "something"**

Set the numbers of days between each retest of domains present into the database of *INACTIVE* and *INVALID* domains.

**Default value:** 1

---

**Note:** This argument is only used if `-db` or `inactive_database : true` (under `.PyFunceble.yaml`) are activated.

---

**--debug**

Switch the value of the debug mode.

**Default value:** False

This argument activates the debug mode. Under the debug mode, everything caught by the whois subsystem is saved.

**Warning:** Do not use this argument unless you have been told to.

**--directory-structure**

Generate the directory and files that are needed and which does not exist in the current directory.

Want to start without anything? This argument generates the output directory automatically for you!

---

**Note:** In case of a file or directory not found issue, it's recommended to remove the `dir_structure.json` along with the `output/` directory before using this argument.

---

**-ex | --execution**

Switch the default value of the execution time showing.

**Default value:** False

Want to know the execution time of your test? Well, this argument will let you know!

**-f "something" | --file "something"**

Read the given file and test all domains inside it. If a URL is given we download and test the content of the given URL.

---

**Note:** We consider one line as one domain or one commented line. A line can be commented at the end.

---

**Note:** You can give a raw link and the system will download and test its content.

---

**--filter "something"**

Domain to filter (regex).

Want to test all `blogspot` from your list? This argument allows you to do that!

---

**Note:** This argument should be a regex expression.

---

**--help**

Show the help message and exit.

**-h | --host**

Switch the value of the generation of hosts file.

**Default value:** True

This argument will let the system know if it has to generate the hosts file version of each status.

**--hierarchical**

Switch the value of the hierarchical sorting of the tested file.

**Default value:** True

This argument will let the system know if we have to sort the list and our output in hierarchical order.

**--http**

Switch the value of the usage of HTTP code.

**Default value:** True

You don't want to take the result of the HTTP code execution in consideration? This argument allows you to disable that!

---

**Note:** If activated the subsystem will bypass the HTTP status code extraction logic-representation.rst

---

**--iana**

Update/Generate *iana-domains-db.json*.

This argument generates or updates *iana-domains-db.json*.

**--idna**

Switch the value of the IDNA conversion.

**Default value:** False

This argument allows the conversion of the domains using [domain2idna](#)

**Warning:** This feature is not supported yet for the URL testing.

**-ip "something"**

Change the IP to print with the hosts files.

**Default value:** 0.0.0.0

**--json**

Switch the value of the generation of the JSON formatted list of domains.

**Default value:** False

**--less**

**When activated:**

Domain	Status	HTTP Code
pyfunceble.readthedocs.io	ACTIVE	302

**When deactivated:**

Domain	Status	Expiration Date	Source	HTTP Code
pyfunceble.readthedocs.io	ACTIVE	Unknown	NSLOOKUP	302

**--local**

Switch the value of the local network testing.

**Default value:** False

Want to run a test over a local or private network? This argument will disable the limitation which does not apply to private networks.

**--link "something"**

Download and test the given file.

Want to test a raw link? This argument will download and test the given raw link.

**-m | --mining**

Switch the value of the mining subsystem usage.

**Default value:** False

Want to find domain or URL linked to a domain in your list? This argument will exactly do that.

**-n | --no-files**

Switch the value the production of output files.

**Default value:** False

Want to disable the production of the outputted files? This argument is for you!

**-nl | --no-logs**

Switch the value of the production of logs files in the case we encounter some errors.

**Default value:** False

Don't want any logs to go out of PyFunceble? This argument disables every logs subsystem.

**-nu | --no-unified**

Switch the value of the production unified logs under the output directory.

**Default value:** True

This argument disables the generation of *result.txt*.

**-nw | --no-whois**

Switch the value the usage of whois to test domain's status.

**Default value:** False

Don't want to use or take in consideration the results from whois? This argument allows you to disable it!

**-p | --percentage**

Switch the value of the percentage output mode.

**Default value:** True

This argument will disable or enable the generation of the percentage of each status.

**--plain**

Switch the value of the generation of the plain list of domains.

**Default value:** False

Want to get a list with all domain for each status? The activation of this argument does the work while testing!

**--production**

Prepare the repository for production.

**Warning:** Do not use this argument unless you have been told to, you prepare a Pull Request or you want to distribute your modified version of PyFunceble.

**-psl | --public-suffix**

Update/Generate *public-suffix.json*.

This argument will generate or update *public-suffix.json*.

**-q | --quiet**

Run the script in quiet mode.

**Default value:** False

You prefer to run a program silently? This argument is for you!

**--share-logs**

Switch the value of the sharing of logs.

**Default value:** True

Want to make PyFunceble a better tool? Share your logs with our API which collect all logs!

**-s | --simple**

Switch the value of the simple output mode.

**Default value:** False

Want as less as possible data on screen? This argument returns as less as possible on screen!

**--split**

Switch the value of the split of the generated output

**Default value:** True

Want to get the logs (copy of what you see on screen) on different files? This argument is suited to you!

### --syntax

Switch the value of the syntax test mode.

**Default value:** False

**-t "something" | --timeout "something"**

Switch the value of the timeout.

**Default value:** 3

This argument will set the default timeout to apply everywhere it is possible to set a timeout.

### --travis

Switch the value of the Travis mode.

**Default value:** False

Want to use PyFunceble under Travis CI? This argument is suited for your need!

**-url "something" | --url "something"**

Analyze the given URL.

Want to test the availability or an URL? Enjoy this argument!

---

**Note:** When we test the availability of an URL, we check the HTTP status code of the given URL.

---

**-uf "something" | --url-file "something"**

Read and test the list of URL of the given file. If a URL is given we download and test the content of the given URL.

---

**Note:** We consider one line as one URL to test.

---

---

**Note:** You can give a raw link and the system will download and test its content.

---

**-ua "something" | --user-agent "something"**

Set the user-agent to use and set every time we interact with everything which is not our logs sharing system.

**-v | --version**

Show the version of PyFunceble and exit.

**-vsc | --verify-ssl-certificate**

Switch the value of the verification of the SSL/TLS certificate when testing for URL.

**Default value:** False

**Warning:** If you activate the verification of the SSL/TLS certificate, you may get **false positive** results.

Indeed if the certificate is not registered to the CA or is simply invalid and the domain is still alive, you will always get `INACTIVE` as output.

**-wdb | --whois-database**

Switch the value of the usage of a database to store whois data in order to avoid whois servers rate limit.

**Default value:** True

## 7.1.2 Global overview

```
usage: PyFunceble [-ad] [-a] [-c] [--autosave-minutes AUTOSAVE_MINUTES]
                  [--clean] [--clean-all] [--cmd CMD]
                  [--cmd-before-end CMD_BEFORE_END]
                  [--commit-autosave-message COMMIT_AUTOSAVE_MESSAGE]
                  [--commit-results-message COMMIT_RESULTS_MESSAGE]
                  [-d DOMAIN] [-db] [-dbr DAYS_BETWEEN_DB_RETEST] [--debug]
                  [--directory-structure] [-ex] [-f FILE] [--filter FILTER]
                  [--help] [--hierarchical] [-h] [--http] [--iana] [--idna]
                  [-ip IP] [--json] [--less] [--local] [--link LINK] [-m] [-n]
                  [-nl] [-nu] [-nw] [-p] [--plain] [--production] [-psl] [-q]
                  [--share-logs] [-s] [--split] [--syntax] [-t TIMEOUT]
                  [--travis] [--travis-branch TRAVIS_BRANCH] [-u URL]
                  [-uf URL_FILE] [-ua USER_AGENT] [-v] [-vsc] [-wdb]
```

optional arguments:

<code>-ad, --adblock</code>	Switch the decoding of the adblock format. Configured value: False
<code>-a, --all</code>	Output all available informations on screen. Configured value: True
<code>-c, --auto-continue, --continue</code>	Switch the value of the auto continue mode. Configured value: True
<code>--autosave-minutes AUTOSAVE_MINUTES</code>	Update the minimum of minutes before we start committing to upstream under Travis CI. Configured value: 15
<code>--clean</code>	Clean all files under output.
<code>--clean-all</code>	Clean all files under output and all file generated by PyFunceble.
<code>--cmd CMD</code>	Pass a command to run before each commit (except the final one) under the travis mode. Configured value: ''
<code>--cmd-before-end CMD_BEFORE_END</code>	Pass a command to run before the results (final)

(continues on next page)

(continued from previous page)

```

        commit under the Travis mode. Configured
        value: ''
--commit-autosave-message COMMIT_AUTOSAVE_MESSAGE
        Replace the default autosave commit message.
        Configured value: 'PyFunceble -
        AutoSave'
--commit-results-message COMMIT_RESULTS_MESSAGE
        Replace the default results (final) commit message.
        Configured value: 'PyFunceble -
        Results'
-d DOMAIN, --domain DOMAIN
        Set and test the given domain.
-db, --database
        Switch the value of the usage of a database to store
        inactive domains of the currently tested list.
        Configured value: True
-dbr DAYS_BETWEEN_DB_RETEST, --days-between-db-retest DAYS_BETWEEN_DB_RETEST
        Set the numbers of days between each retest of
        domains present into inactive-db.json.
        Configured value: 1
--debug
        Switch the value of the debug mode.
        Configured value: False
--directory-structure
        Generate the directory and files that are needed and
        which does not exist in the current directory.
-ex, --execution
        Switch the default value of the execution time
        showing. Configured value: False
-f FILE, --file FILE
        Read the given file and test all domains inside it. If
        a URL is given we download and test the content of the
        given URL.
--filter FILTER
        Domain to filter (regex).
--help
        Show this help message and exit.
--hierarchical
        Switch the value of the hierarchical sorting of tested
        file. Configured value: True
-h, --host
        Switch the value of the generation of hosts file.
        Configured value: True
--http
        Switch the value of the usage of HTTP code.
        Configured value: True
--iana
        Update/Generate `iana-domains-db.json`.
--idna
        Switch the value of the IDNA conversion.
        Configured value: False
-ip IP
        Change the IP to print in the hosts files with the given_
one.
        Configured value: '0.0.0.0'
--json
        Switch the value of the generation of the json list of
        domain. Configured value: False
--less
        Output less informations on screen.
        Configured value: False
--local
        Switch the value of the local network testing.
        Configured value: True
--link LINK
        Download and test the given file.
-m, --mining
        Switch the value of the mining subsystem usage.
        Configured value: False
-n, --no-files
        Switch the value of the production of output files.
        Configured value: False
-nl, --no-logs
        Switch the value of the production of logs files in
        the case we encounter some errors. Configured
        value: False

```

(continues on next page)

(continued from previous page)

-nu, --no-unified	Switch the value of the production unified logs under the output directory. Configured value: True
-nw, --no-whois	Switch the value the usage of whois to test domain's status. Configured value: False
-p, --percentage	Switch the value of the percentage output mode. Configured value: True
--plain	Switch the value of the generation of the plain list of domain. Configured value: False
--production	Prepare the repository for production.
-psl, --public-suffix	Update/Generate `public-suffix.json`.
-q, --quiet	Run the script in quiet mode. Configured value: False
--share-logs	Switch the value of the sharing of logs. Configured value: True
-s, --simple	Switch the value of the simple output mode. Configured value: False
--split	Switch the value of the split of the generated output files. Configured value: True
--syntax	Switch the value of the syntax test mode. Configured value: False
-t TIMEOUT, --timeout TIMEOUT	Switch the value of the timeout. Configured value: 3
--travis	Switch the value of the Travis mode. Configured value: False
--travis-branch TRAVIS_BRANCH	Switch the branch name where we are going to push. Configured value: 'master'
-u URL, --url URL	Analyze the given URL.
-uf URL_FILE, --url-file URL_FILE	Read and test the list of URL of the given file. If a URL is given we download and test the content of the given URL.
-ua USER_AGENT, --user-agent USER_AGENT	Set the user-agent to use and set every time we interact with everything which is not our logs sharing system.
-v, --version	Show the version of PyFunceble and exit.
-vsc, --verify-ssl-certificate	Switch the value of the verification of the SSL/TLS certificate when testing for URL. Configured value: False
-wdb, --whois-database	Switch the value of the usage of a database to store whois data in order to avoid whois servers rate limit. Configured value: True

Crafted with by Nissar Chababy (Funilrys) with the help of <https://pyfunceble.rtfd.io/en/master/contributors.html> & <https://pyfunceble.rtfd.io/en/master/special-thanks.html>

## 7.2 From a Python script or module

Before continuing reading this part, You should know that I consider that you can speak in Python. If it's not the case, well, it's the time to [learn Python!](#)

As PyFunceble is written in Python, it can be easily imported and used inside a script. This part will represent a basic example of usage.

### 7.2.1 Basic example

```
"""
This is a basic example which prints one of the official output of PyFunceble.

Note:
* Official output: ACTIVE, INACTIVE, INVALID
"""

from PyFunceble import test as PyFunceble
from PyFunceble import url_test as PyFuncebleURL

print(PyFunceble(domain='google.com'))
print(PyFuncebleURL(url='https://google.com'))
```

```
"""
This is a basic example which checks syntax.
"""

from PyFunceble import syntax_check as PyFuncebleDomainSyntax
from PyFunceble import url_syntax_check as PyFuncebleURLSyntax
from PyFunceble import ipv4_syntax_check as PyFuncebleIPv4Syntax

print("google.com", PyFuncebleDomainSyntax(domain="google.com"))
print("https://google.com", PyFuncebleURLSyntax(url="https://google.com"))
print("216.58.207.46", PyFuncebleIPv4Syntax(ip="216.58.207.46"))

print("forest-jump", PyFuncebleDomainSyntax(domain="forest-jump"))
print("https://forest-jump", PyFuncebleURLSyntax(url="https://forest-jump"))
print("257.58.207.46", PyFuncebleIPv4Syntax(ip="257.58.207.46"))
```

### 7.2.2 Loop example

This part is unnecessary but we wanted to document it!!

```
"""
This is a loop example which tests a list of domain and processes some action
according to one of the official output of PyFunceble.

Note:
* Official output: ACTIVE, INACTIVE, INVALID
* You should always use PyFunceble().test() as it's the method which is especially
suited for `__name__ != '__main__'` usage.
"""

from PyFunceble import test as PyFunceble
from PyFunceble import url_test as PyFuncebleURL
```

(continues on next page)

(continued from previous page)

```

DOMAINS = ["twitter.com", "google.com", "github.com", "github.comcomcom", "funilrys.co
↪"]

def domain_status(domain_or_ip):
    """
    Check the status of the given domain name or IP.

    Argument:
    - domain_or_ip: str
        The domain or IPv4 to test.

    Returns: str
        The status of the domain.
    """
    return PyFunceble(domain_or_ip)

def url_status(url):
    """
    Check the status of the given url.

    Argument:
    - url: str
        The URL to test.

    Returns: str
        The status of the URL.
    """
    return PyFuncebleURL(url)

for domain in DOMAINS:
    print(
        "%s is %s and %s is %s"
        % (
            domain,
            domain_status(domain),
            "http://" + domain,
            url_status("http://" + domain),
        )
    )
)

```

### 7.2.3 Advanced example

PyFunceble now allow you to get the following information as a dictionary. The objective behind this feature is to let you know more about the element you are testing.

```
{
    "tested": None, # The tested element.
    "expiration_date": None, # The expiration_date of the element if found.
    "domain_syntax_validation": None, # The domain syntax validation status.
```

(continues on next page)

(continued from previous page)

```

    "http_status_code": None, # The status code of the tested element.
    "ip4_syntax_validation": None, # The IPv4 syntax validation status.
    "nslookup": [], # A list of IP of the tested element.
    "status": None, # The status matched by PyFunceble.
    "url_syntax_validation": None, # The url syntax validation status.
    "whois_server": None, # The whois server if found.
    "whois_record": None, # The whois record if whois_server is found.
}

```

To get that information simply work with our interface like follow :)

```

"""
This is an advanced example which prints some information about the tested element.

Note:
* Official output: ACTIVE, INACTIVE, INVALID
"""

from PyFunceble import test as PyFunceble
from PyFunceble import url_test as PyFuncebleURL

domain_testing = PyFunceble(domain='google.com', complete=True)
url_testing = PyFuncebleURL(url='https://google.com', complete=True)

print(domain_testing['nslookup'])
print(domain_testing['domain_syntax_validation'])
print(domain_testing['domain'], domain_testing['status'])

print(url_testing['nslookup'])
print(url_testing['domain_syntax_validation'])
print(url_testing['domain'], domain_testing['status'])

```

## 7.3 From Travis CI

As we offer an argument named `--travis` to activate the usage of PyFunceble in a Travis CI instance, we document here what you need to know!

### 7.3.1 Configuration

---

**Note:** This part only present a commented `.travis.yml` so that you can understand where to start.

If you need more practical examples, feel free to report to one of [Dead-Hosts](#) repositories which use PyFunceble with Travis CI.

---

```

env:
  global:
    # The following is your encrypted GitHub API key.
    # Indeed as we are going to push to the repository, this is needed.
    - secure: QQdKFquFFoJFT9XJ1XZp4EMoDTVoXFgqZq8XU+SCVf+pJQR6d/

# This is the language we use.
language: python

# This is the python version we are going to use for the tests.
# Note: you can add any 3.x version to the list.
python:
- "3.6"

# The following will tell Travis CI to ends as fast as possible.
matrix:
    fast_finish: true

# Here we are setting what Travis CI have to cache.
cache:
    # We are caching pip3 as we use it to install PyFunceble
    - pip3

install:
    # We install the development version of PyFunceble. If you prefer the stable_ ↵version replace `pyfunceble-dev` with `pyfunceble`.
    - pip3 install pyfunceble-dev

# Our tests start here.
script:
    # Let's say we want our results and our PyFunceble infrastructure to be saved in_ ↵a directory called `PyFunceble-tests`'

        # We move inside it.
        - cd PyFunceble-tests
        # We test the file `my_awesome_list` which is located inside the current_ ↵directory.
        # Note: we precise the `--travis` argument here,
        #       but you work without it if you set `travis: true` inside your `PyFunceble. ↵yaml`
        - PyFunceble --travis -f my_awesome_list --plain

# The following initiate email notification logic.
notifications:
    # As we want to get a mail on failure and on status change, we set the following.
    on_success: change
    on_failure: always

```

### 7.3.2 Getting a GitHub token

For the secure index of the `.travis.yml` file, you have to generate a [new GitHub token](#).

After you got your token, please write it or save it in a safe place as you're going to need it every time you're going to

interact with Travis CI.

---

**Note:** The scope to set is `public_repo` but you can also set others depending on your needs.

---

### 7.3.3 Encrypting the token for Travis CI usage

To encrypt the token simply replace and execute the following according to your personal case.

```
$ travis encrypt 'GH_TOKEN=theGeneratedToken' -r 'The content of TRAVIS_REPO_SLUG' --  
→ add
```

**Warning:** Please do not execute the following explicitly without replacing `theGeneratedToken` with your previously generated GitHub token and `The content of TRAVIS_REPO_SLUG` with your repository slug.

---

**Note:** The usage of `--add` ensure that the `travis` program automatically add the `secure` index to the `.travis.yml` file.

---

# CHAPTER 8

---

## Columns

---

Because PyFunceble provides multiple information in a table, we chose to document them all. The objective of this page is to reflect what the code actually do in a more clear and understandable way.

### 8.1 Domains

This column is one of the basic ones as it gives us the name of the last tested domain or IP.

### 8.2 Status

There's 3 possible output for this column.

#### 8.2.1 ACTIVE

This status is returned when **one of the following cases** is met:

- We can extract the expiration date from `Lookup().whois()`.
  - *Please note that we don't check if the date is in the past.*
- `Lookup().nslookup()` don't return an error.
  - *Please note that we don't read the returned value.*
- `HTTPCode().get()` return one the following code [100, 101, 200, 201, 202, 203, 204, 205, 206].

#### 8.2.2 INACTIVE

This status is returned when **all the following cases** are met:

- We can't extract the expiration date from `Lookup().whois()`.
- `Lookup().nslookup()` don't return an error.

### 8.2.3 INVALID

This status is returned when **all the following cases** are met:

- Domain/IP does not match pass our syntax checker.
- Domain extension is unregistered in [IANA Root Zone Database](#).

---

**Note:** Understand by this that the extension is not present in the `iana-domains-db.json` file.

---

### 8.2.4 VALID

This status is returned when we are checking for syntax. It is the equivalent of ACTIVE but for syntax checking.

## 8.3 Expiration Date

There's two possible output for this column.

### 8.3.1 Unknown

`Unknown` is returned when we could not extract the expiration date from `Lookup().whois()` outputs.

### 8.3.2 A date

Only if we could extract the expiration date from `Lookup().whois()`, the date becomes formatted like `02-jan-2017`.

## 8.4 Source

At this time, there's 5 possible output for this column.

### 8.4.1 HTTP Code

This source is returned when **all the following cases** are met:

- We can't extract the expiration date from `Lookup().whois()`.
- The `INACTIVE` status is the one returned by other methods.
- `HTTPCode().get()` outputs is one the following [100, 101, 200, 201, 202, 203, 204, 205, 206].

## 8.4.2 IANA

This source is always returned when the domain has the status `INVALID`. The usage of this source comes from the comparison of the element extension against the [IANA Root Zone Database](#).

## 8.4.3 SYNTAX

This source is always returned when the domain has the status `INVALID` or in the case that we are only checking for syntax instead of availability. The usage of this source comes from the comparison of the element against our domain, IP or URL syntax validation system.

## 8.4.4 NSLOOKUP

This source is always returned when the taken decision of the status of the domain/IP comes from `Lookup().nslookup()` outputs.

## 8.4.5 SPECIAL

As PyFunceble grows, I thought that a bit of filtering for special cases would be great. So I introduced the `SPECIAL` source.

---

**Note:** Please consider all 3 digits number that are listed in this section as the HTTP status code catched by `HTTPCode().get()`.

---

### \*.blogspot.\*

- All 404 are returned as `INACTIVE`
- All 301 which are blocked by Google or does not exist are returned as `INACTIVE`
- All 302 which are blocked by Google are returned as `INACTIVE`

### \*.canalblog.com

- All 404 are returned as `INACTIVE`

### \*.doubleclick.net

- All 404 are returned as `INACTIVE`

### \*.liveadvert.com

- All 404 are returned as `INACTIVE`

### \*.skyrock.com

- All 404 are returned as `INACTIVE`

**\*.tumblr.com**

- All 404 are returned as INACTIVE

**\*.wordpress.com**

- All 301 which match doesn't exist are returned as INACTIVE

**IP with range**

- All IPv4 with a range (for example 0.0.0.0/24) are returned as ACTIVE

## 8.5 HTTP Code

---

**Note:** This section reflects exactly what the code does. So any changes made here should also be reported to the code or at least the configuration file.

---

---

**Note:** A \*\*\* in this column means that it was impossible to catch the HTTP status code from the web server.

---

We have categorized the HTTP Code into 3 parts.

- Active
  - Consider those ones like the one that influences HTTP source logic.
  - Please note that the domain is automatically introduced into the official outputs but we keep a record of it output/Analytic/ACTIVE.
- Potentially Active
  - If the domain status returned by other methods are different from INACTIVE or INVALID and the HTTP status code is into that list, we save the domain into output/Analytic/POTENTIALLY\_ACTIVE
- Inactive or potentially inactive
  - If the domain status returned by other methods are different from ACTIVE and the HTTP status code is on that list, we save the domain into output/Analytic/POTENTIALLY\_INACTIVE

### 8.5.1 As active

- 100 - Continue
- 101 - Switching Protocols
- 200 - OK
- 201 - Created
- 202 - Accepted
- 203 - Non-Authoritative Information
- 204 - No Content

- 205 - Reset Content
- 206 - Partial Content

### 8.5.2 As potentially active

- 000
- 300 - Multiple Choices
- 301 - Moved Permanently
- 302 - Found
- 303 - See Other
- 304 - Not Modified
- 305 - Use Proxy
- 307 - Temporary Redirect
- 403 - Forbidden
- 405 - Method Not Allowed
- 406 - Not Acceptable
- 407 - Proxy Authentication Required
- 408 - Request Timeout
- 411 - Length Required
- 413 - Request Entity Too Large
- 417 - Expectation Failed
- 500 - Internal Server Error
- 501 - Not Implemented
- 502 - Bad Gateway
- 503 - Service Unavailable
- 504 - Gateway Timeout
- 505 - HTTP Version Not Supported

### 8.5.3 As inactive or potentially inactive

- 400 - Bad Request
- 401 - Unauthorized
- 402 - Payment Required (Not in use but may be seen in the future)
- 404 - Not Found
- 409 - Conflict
- 410 - Gone
- 412 - Precondition Failed
- 414 - Request-URI Too Long

- 415 - Unsupported Media Type
- 416 - Requested Range Not Satisfiable

# CHAPTER 9

---

## Logs Sharing

---

### 9.1 Why logs sharing?

We chose to initiate the logs sharing as some actions can really be random when working with millions of domains. The idea and purpose of this feature are **ONLY** to make PyFunceble a better tool.

### 9.2 What do we share/collect?

Event	Shared	URL
No WHOIS server (referer) is found.	<ul style="list-style-type: none"><li>The extension of the currently tested domain.</li></ul>	<a href="https://pyfunceble.funilrys.com/api/no-referer">https://pyfunceble.funilrys.com/api/no-referer</a>
The expiration date is not correctly formatted.	<ul style="list-style-type: none"><li>The extracted expiration date.</li><li>The currently tested domain.</li><li>The currently used WHOIS server (DNS) name.</li></ul>	<a href="https://pyfunceble.funilrys.com/api/date-format">https://pyfunceble.funilrys.com/api/date-format</a>

### 9.3 How to share logs?

The logs sharing is activated by default.

If you do not wish to share your logs simply change

share_logs:	<b>True</b>
-------------	-------------

to

share_logs:	<b>False</b>
-------------	--------------

into your personal *.PyFunceble.yaml*.

# CHAPTER 10

---

## Logic representation

---

Don't have time to review the code and want to know exactly what PyFunceble does in general? This flowchart is there for you!

---

**Note:** This is a simplified version of what we actually do.

---

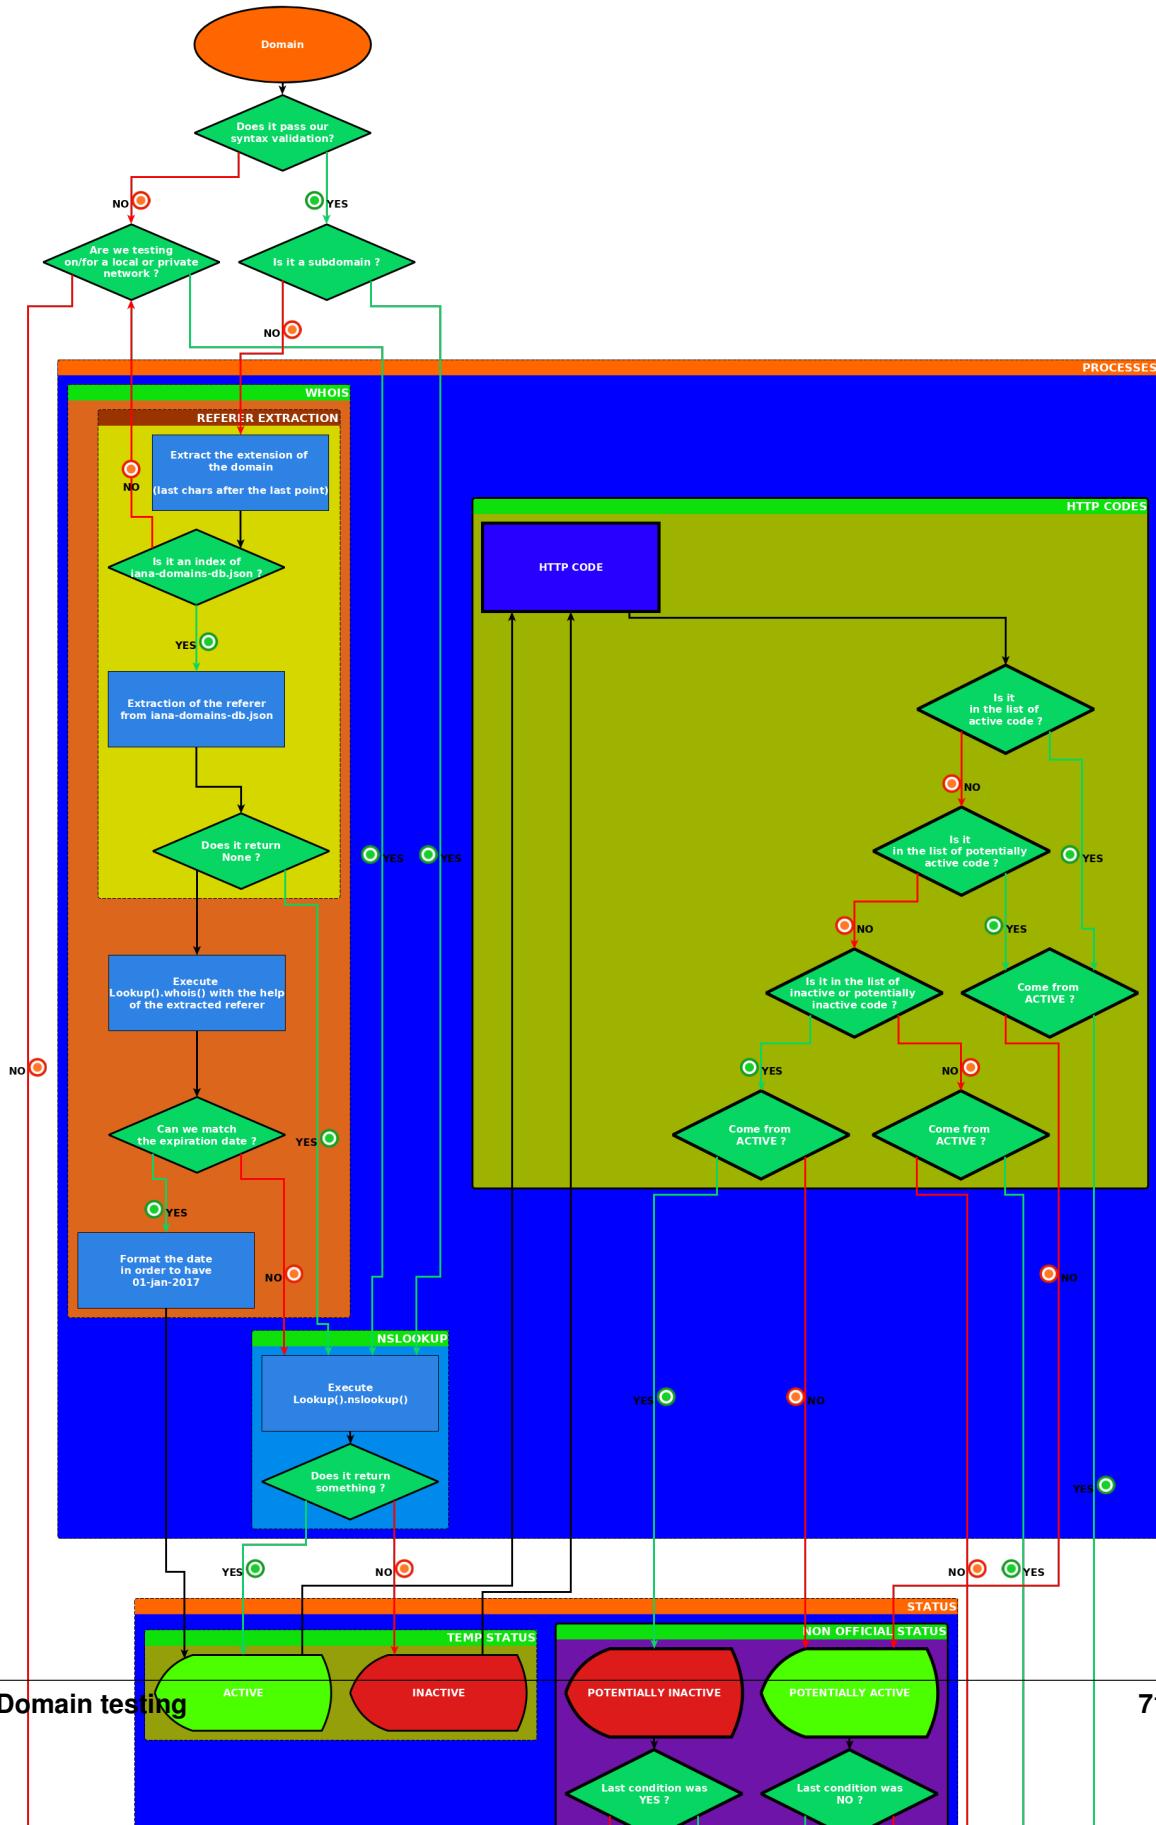

---

**Note:** The diagrams were generated with the help of [yEd Graph Editor](#).

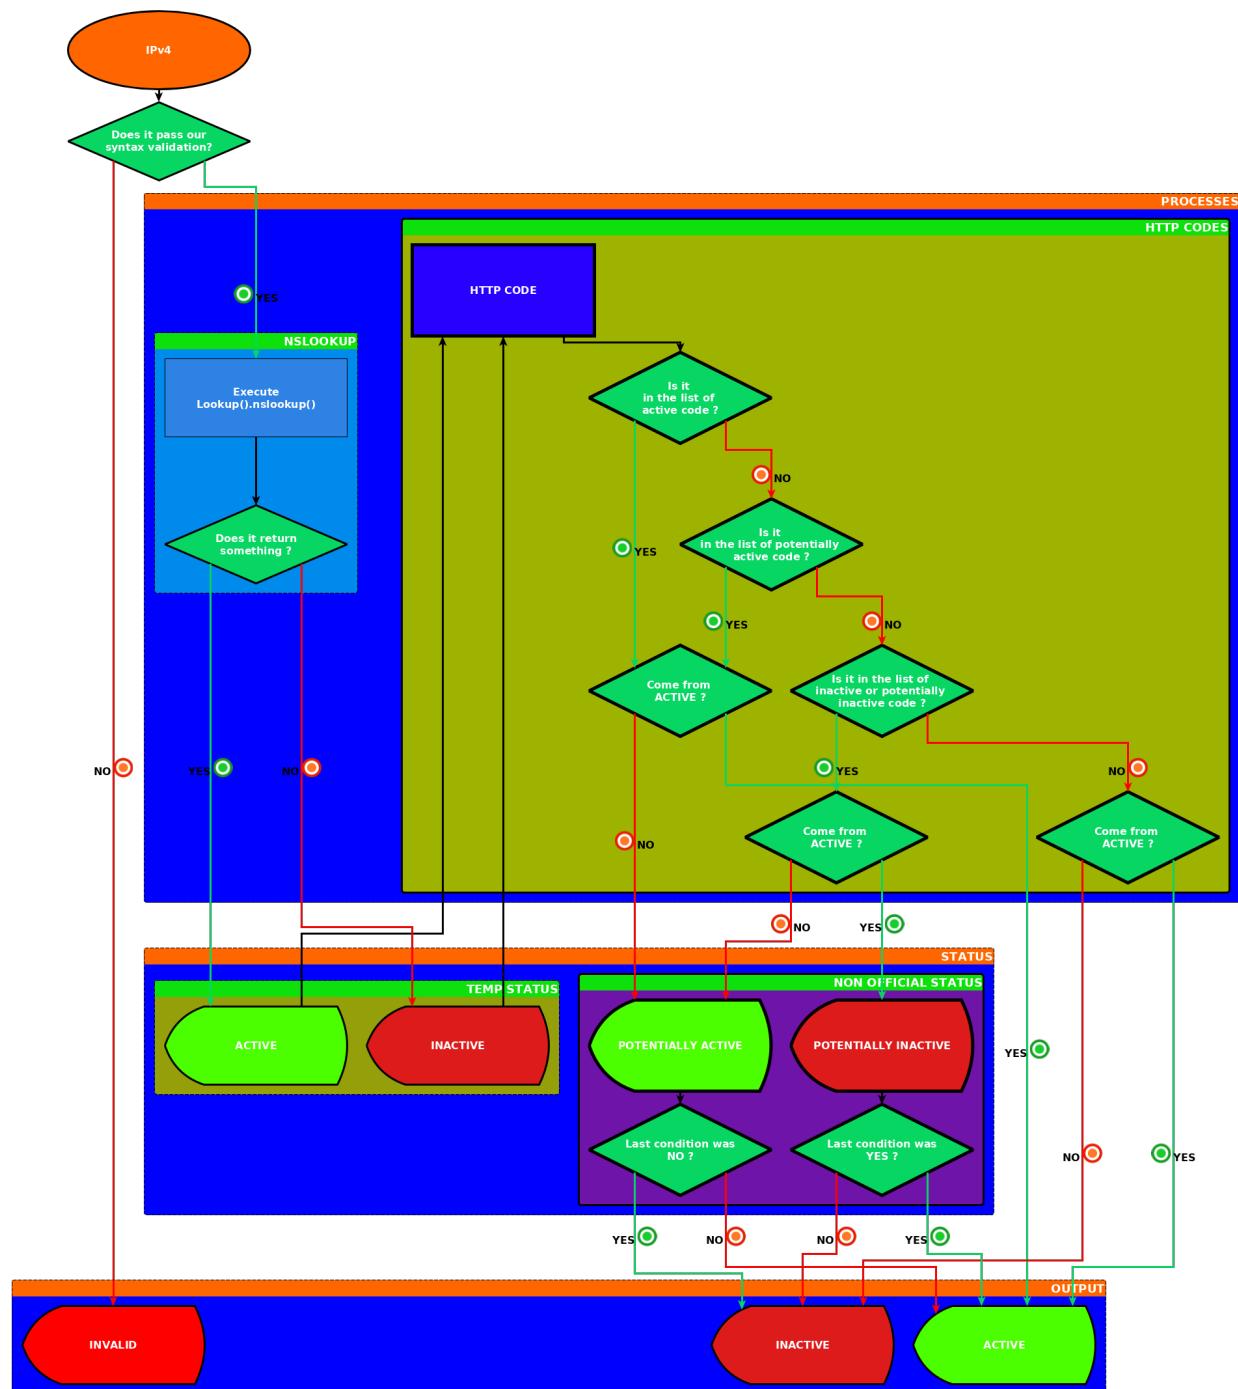

---

## 10.1 Domain testing

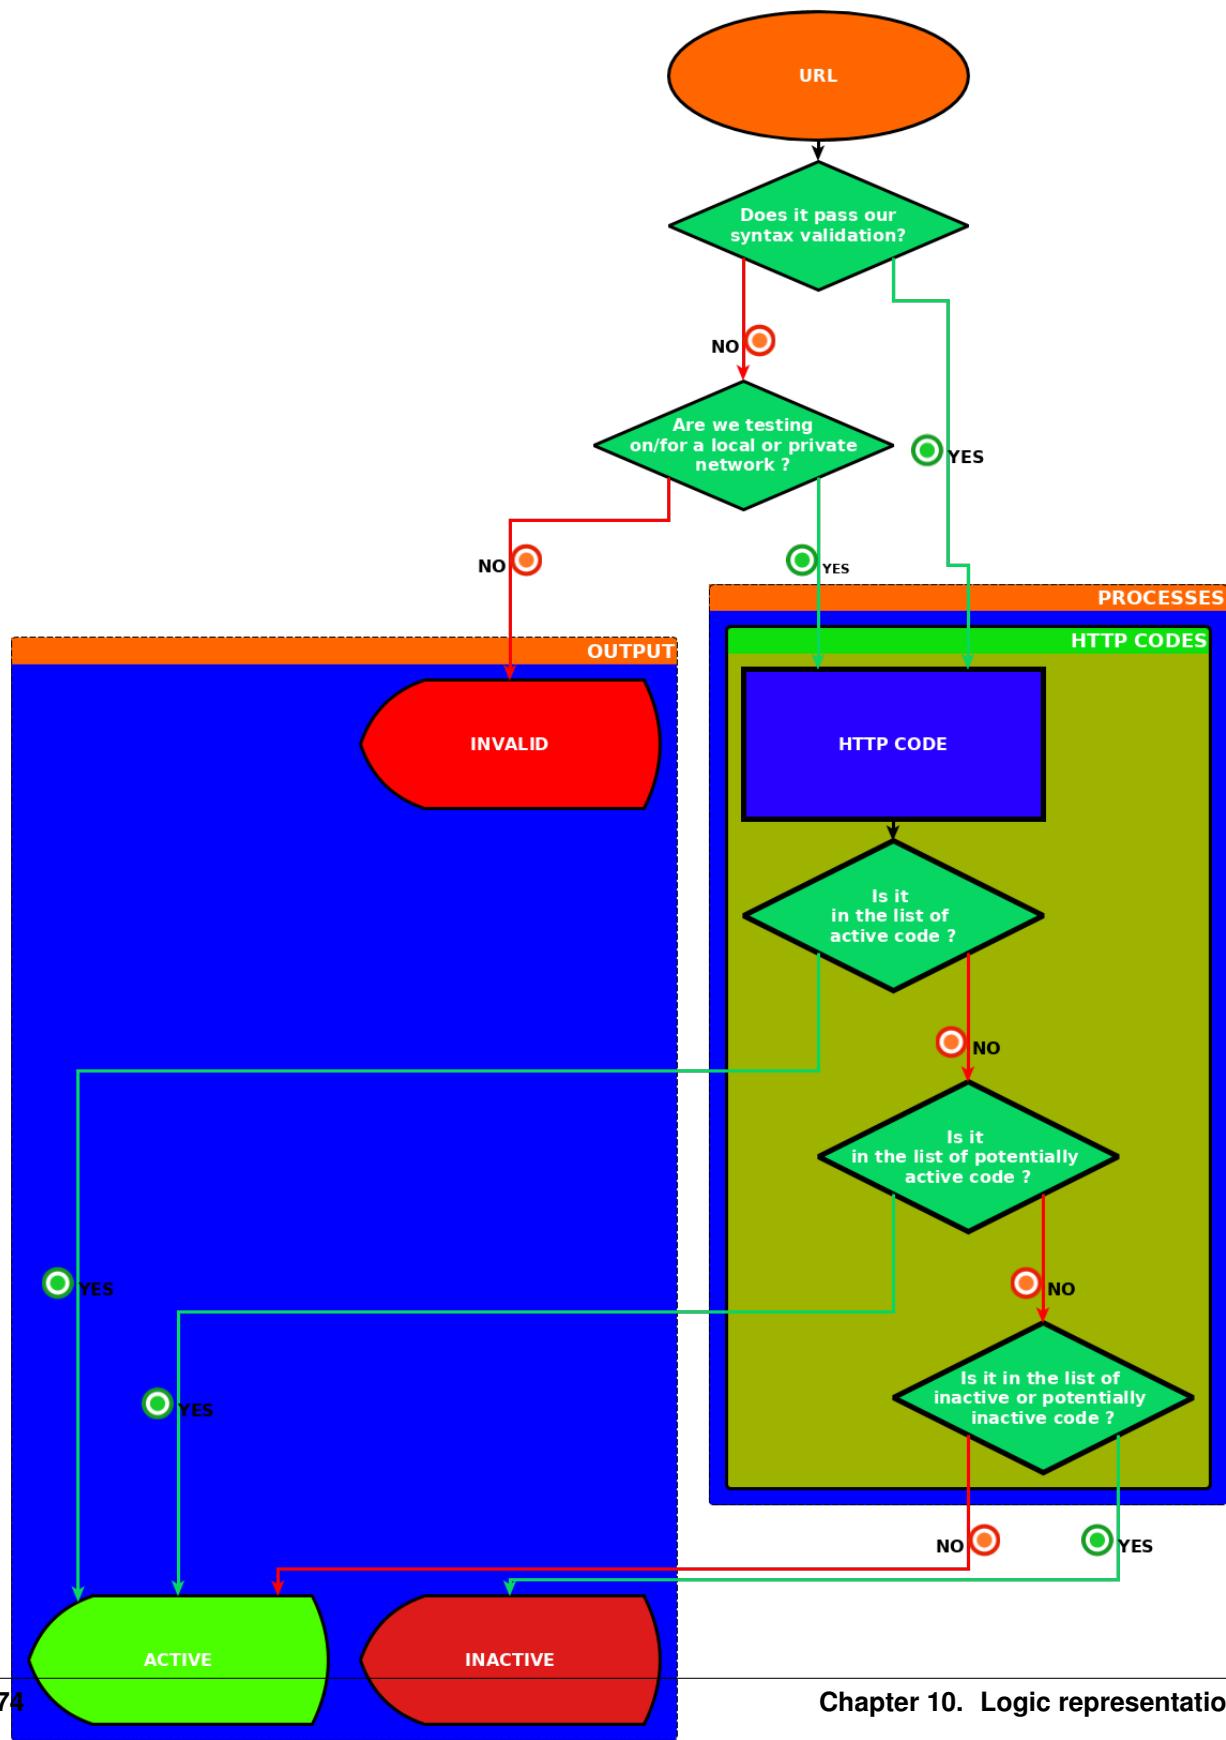

## 10.2 IP testing

## 10.3 URL testing

# CHAPTER 11

---

## API documentation

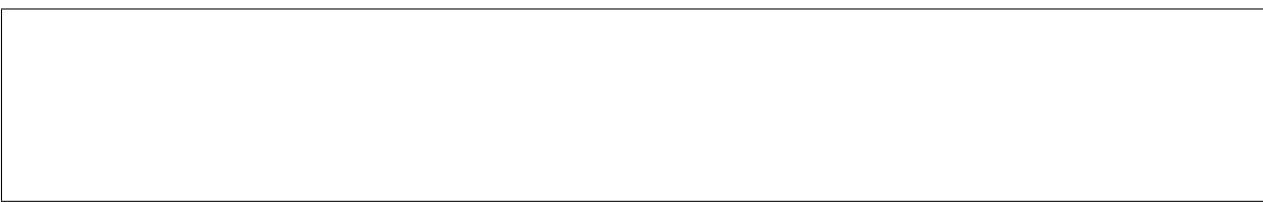

---

---

**Note:** This section document what you can call directly when you use PyFunceble as an imported module.

---

The tool to check the availability or syntax of domains, IPv4 or URL.

This submodule is the main entry of PyFunceble.

---

**PyFunceble.ipv4\_syntax\_check (ip)**

Check the syntax of the given IPv4.

**Parameters** **ip** (*str*) – The IPv4 to check the syntax for.

**Returns** The syntax validity.

**Return type** bool

**PyFunceble.load\_config (*under\_test=False*)**

Load the configuration.

**Parameters** **under\_test** (*bool*) – Tell us if we only have to load the configuration file (True) or load the configuration file and initiate the output directory if it does not exist (False).

**PyFunceble.syntax\_check (*domain*)**

Check the syntax of the given domain.

**Parameters** **domain** (*str*) – The domain to check the syntax for.

**Returns** The syntax validity.

**Return type** bool

**PyFunceble.test (*domain, complete=False*)**

Test the availability of the given domain or IP.

**Parameters**

- **domain** (*str*) – The domain or IP to test.
- **complete** (*bool*) – Activate the return of a dict with some significant data from the test.

**Returns** The status or the informations of the domain.

**Return type** str|dict

---

**Note:** This function abstract and simplify for the access to the core for the end-user.

---

**PyFunceble.url\_syntax\_check (*url*)**

Check the syntax of the given URL.

**Parameters** **url** (*str*) – The URL to check the syntax for.

**Returns** The syntax validity.

**Return type** bool

`PyFunceble.url_test(url, complete=False)`

Test the availability of the given URL.

**Parameters**

- `url (str)` – The URL to test.
- `complete (bool)` – Activate the return of a dict with some significant data from the test.

**Returns** The status or the informations of the URL.

**Return type** str|dict

---

**Note:** This function abstract and simplify for the access to the core for the end-user.

---

# CHAPTER 12

---

## Code Documentation

---

---

**Note:** This section will document every part (except the API section) of our code base.

---

### 12.1 Helpers

#### 12.1.1 Problematic

How can we avoid writing the same thing every time?

#### 12.1.2 Documentation

The tool to check the availability or syntax of domains, IPv4 or URL.

This submodule will provide the helpers.

SOFTWARE.
```

```
class PyFunceble.helpers.Command(command)
```

Shell command execution.

**Parameters** `command` (`str`) – The command to execute

`_decode_output` (`to_decode`)

Decode the output of a shell command in order to be readable.

**Parameters** `to_decode` – Output of a command to decode.

**Type** `bytes`

**Returns** The decoded output.

**Return type** `str`

`execute()`

Execute the given command.

**Returns** The output of the command.

**Return type** `str`

```
class PyFunceble.helpers.Dict(main_dictionnary=None)
```

Dictionary manipulations.

**Parameters** `main_dictionnary` (`dict`) – The dict we are working with.

`classmethod from_json` (`data`)

Convert a JSON formatted string into a dictionary.

**Parameters** `data` (`str`) – A JSON formatted string to convert to dict format.

**Returns** The dict representation of the JSON formatted string.

**Return type** `dict`

**classmethod** `from_yaml(data)`

Convert a YAML formatted string into a dictionary.

**Parameters** `data (str)` – A YAML formatted string to convert to dict format.

**Returns** The dict representation of the YAML formatted string.

**Return type** dict

**merge(to\_merge, strict=True)**

Merge the content of `to_merge` into the given main dictionnary.

**Parameters**

- `to_merge (dict)` – The dictionnary to merge.

- `strict (bool)` – Tell us if we have to strictly merge lists.

True: We follow index :code:`False`: We follow element (content)

**Returns** The merged dict.

**Return type** dict

**remove\_key(key\_to\_remove)**

Remove a given key from a given dictionary.

**Parameters** `key_to_remove (list / str)` – The key(s) to delete.

**Returns** The dict without the given key(s).

**Return type** dict|None

**rename\_key(key\_to\_rename, strict=True)**

Rename the given keys from the given dictionary.

**Parameters**

- `key_to_rename (dict)` – The key(s) to rename. Expected format: {old:new}

- `strict` – Tell us if we have to rename the exact index or the index which looks like the given key(s)

**Returns** The well formatted dict.

**Return type** dict|None

**to\_json(destination)**

Save a dictionnary into a JSON file.

**Parameters** `destination (str)` – A path to a file where we're going to write the converted dict into a JSON format.

**to\_yaml(destination, flow\_style=False)**

Save a dictionnary into a YAML file.

**Parameters** `destination (str)` – A path to a file where we're going to write the converted dict into a JSON format.

**class** `PyFunceble.helpers.Directory(directory)`

Directory manipulation.

**Parameters** `directory (str)` – A path to the directory to manipulate.

**fix\_path(splited\_path=None)**

Fix the path of the given path.

**Parameters** `splited_path (list)` – A list to convert to the right path.

**Returns** The fixed path.

**Return type** str

```
class PyFunceble.helpers.Download(link, destination=None, return_data=False, verify_certificate=True)
```

Download or return the content of the given link.

#### Parameters

- **link** (str) – The link to download.
- **destination** (str) – The location where we should save the downloaded content.
- **return\_data** (bool) – Tell us if we need to return the page content or write its content into the given destination.
- **verify\_certificate** (bool) – Tell us if we need to verify the SSL/TLS certificate.

```
text()
```

Download the given link and return or save its `requests.text` at the given destination.

**Return type** mixed

#### Raises

**Exception** If the status code is not 200.

```
class PyFunceble.helpers.File(file)
```

File treatment/manipulations.

**Parameters** `file` (str) – A path to the file to manipulate.

```
copy(destination)
```

Copy the given file to the destination.

**Parameters** `destination` (str) – The destination of the copy.

```
delete()
```

Delete a given file path.

```
read()
```

Read a given file path and return its content.

**Returns** The content of the given file path.

**Return type** str

```
write(data_to_write, overwrite=False)
```

Write or append data into the given file path.

#### Parameters

- **data\_to\_write** (str) – The data to write.
- **overwrite** (bool) – Tell us if we have to overwrite the content of the file we are working with.

```
class PyFunceble.helpers.Hash(file_path=None, algorithm='sha512', only_hash=False, data=None)
```

Get and return the hash a file with the given algorithm.

#### Parameters

- **file\_path** (str) – The path to the file we have to hash.
- **algorithm** (str) – The algorithm to use.

- **only\_hash** – Tell us if we only have to return the desired algorithm instead of the dummy dict format.

---

**Note:** The original version can be found at <https://git.io/vFQrK>.

---

**\_hash\_data (algo)**

Get hash of the given data.

**Parameters algo** (*str*) – The algorithm to use.

**\_hash\_file (algo)**

Get the hash of the given file

**Parameters algo** (*str*) – The algorithm to use.

**Returns** The hexdigest of the data.

**Return type** str

**get()**

Return the hash of the given file

**class PyFunceble.helpers.List (main\_list=None)**

List manipulation.

**Parameters main\_list** (*list*) – The list to manipulate.

**custom\_format (key\_method, reverse=False)**

Return a well formatted list. With the key\_method as a function/method to format the elements before sorting.

**Parameters**

- **key\_method** (*function /method*) – A function or method to use to format the readed element before sorting.

- **reverse** (*bool*) – Tell us if we have to reverse the list.

**Returns** A sorted list.

**Return type** list

**format()**

Return a well formatted list. Basicly, it's sort a list and remove duplicate.

**Returns** A sorted, without duplicate, list.

**Return type** list

**merge (to\_merge, strict=True)**

Merge to\_merge into the given main list.

**Parameters**

- **to\_merge** (*list*) – The list to merge.
- **strict** (*bool*) – Tell us if we have to respect index (True) or not (False).

**Returns** The merged list.

**Return type** list

**class PyFunceble.helpers.Regex (data, regex, \*\*args)**

A simple implementation of the python.re package

### Parameters

- **data** (*str*) – The data to check.
- **regex** (*str*) – The regex to match.
- **group** (*int*) – The group to return.
- **rematch** (*bool*) – Allow to return the matched groups into a formatted list.

---

**Note:** This is an implementation of Bash \${BASH\_REMATCH}

---

- **replace\_with** (*str*) – The value to replace the matched regex with.
- **occurrences** (*int*) – The number of occurrence(s) to replace.
- **return\_type** – Tell us if we have to return the matched data or simply check if we matched (True) or not (False)

### `match()`

Used to get exploitable result of re.search

**Returns** The data of the match status.

**Return type** mixed

### `matching_list()`

Return a list of the string which match the given regex.

### `not_matching_list()`

Return a list of string which don't match the given regex.

### `replace()`

Used to replace a matched string with another.

**Returns** The data after replacement.

**Return type** str

## `Download()`

```
class PyFunceble.helpers.Download(link, destination=None, return_data=False, verify_certificate=True)
```

Download or return the content of the given link.

### Parameters

- **link** (*str*) – The link to download.
- **destination** (*str*) – The location where we should save the downloaded content.
- **return\_data** (*bool*) – Tell us if we need to return the page content or write its content into the given destination.
- **verify\_certificate** (*bool*) – Tell us if we need to verify the SSL/TLS certificate.

### `text()`

Download the given link and return or save its `requests.text` at the given destination.

**Return type** mixed

### Raises

**Exception** If the status code is not 200.

## Command()

```
class PyFunceble.helpers.Command(command)
    Shell command execution.
```

**Parameters** `command` (`str`) – The command to execute

`_decode_output` (`to_decode`)

Decode the output of a shell command in order to be readable.

**Parameters** `to_decode` – Output of a command to decode.

**Type** bytes

**Returns** The decoded output.

**Return type** str

`execute()`

Execute the given command.

**Returns** The output of the command.

**Return type** str

## Regex()

```
class PyFunceble.helpers.Regex(data, regex, **args)
    A simple implementation of the python.re package
```

**Parameters**

- `data` (`str`) – The data to check.
- `regex` (`str`) – The regex to match.
- `group` (`int`) – The group to return.
- `rematch` (`bool`) – Allow to return the matched groups into a formatted list.

---

**Note:** This is an implementation of Bash \${BASH\_REMATCH}

---

- `replace_with` (`str`) – The value to replace the matched regex with.
- `occurrences` (`int`) – The number of occurrence(s) to replace.
- `return_type` – Tell us if we have to return the matched data or simply check if we matched (True) or not (False)

`match()`

Used to get exploitable result of re.search

**Returns** The data of the match status.

**Return type** mixed

`matching_list()`

Return a list of the string which match the given regex.

`not_matching_list()`

Return a list of string which don't match the given regex.

**replace()**

Used to replace a matched string with another.

**Returns** The data after replacement.

**Return type** str

**Dict()**

**class** PyFunceble.helpers.Dict(*main\_dictionnary=None*)

Dictionary manipulations.

**Parameters** **main\_dictionnary**(*dict*) – The dict we are working with.

**classmethod** from\_json(*data*)

Convert a JSON formatted string into a dictionary.

**Parameters** **data**(*str*) – A JSON formatted string to convert to dict format.

**Returns** The dict representation of the JSON formatted string.

**Return type** dict

**classmethod** from\_yaml(*data*)

Convert a YAML formatted string into a dictionary.

**Parameters** **data**(*str*) – A YAML formatted string to convert to dict format.

**Returns** The dict representation of the YAML formatted string.

**Return type** dict

**merge**(*to\_merge*, strict=True)

Merge the content of *to\_merge* into the given main dictionnary.

**Parameters**

- **to\_merge**(*dict*) – The dictionnary to merge.
- **strict**(*bool*) – Tell us if we have to strictly merge lists.

True: We follow index :code:`False`: We follow element (content)

**Returns** The merged dict.

**Return type** dict

**remove\_key**(*key\_to\_remove*)

Remove a given key from a given dictionary.

**Parameters** **key\_to\_remove**(*list/str*) – The key(s) to delete.

**Returns** The dict without the given key(s).

**Return type** dict|None

**rename\_key**(*key\_to\_rename*, strict=True)

Rename the given keys from the given dictionary.

**Parameters**

- **key\_to\_rename**(*dict*) – The key(s) to rename. Expected format: {old:new}
- **strict** – Tell us if we have to rename the exact index or the index which looks like the given key(s)

**Returns** The well formatted dict.

**Return type** dict|None

**to\_json**(*destination*)

Save a dictionnary into a JSON file.

**Parameters** **destination** (*str*) – A path to a file where we’re going to write the converted dict into a JSON format.

**to\_yaml**(*destination*, *flow\_style=False*)

Save a dictionnary into a YAML file.

**Parameters** **destination** (*str*) – A path to a file where we’re going to write the converted dict into a JSON format.

## List()

**class** PyFunceble.helpers.List(*main\_list=None*)

List manipulation.

**Parameters** **main\_list** (*list*) – The list to manipulate.

**custom\_format**(*key\_method*, *reverse=False*)

Return a well formatted list. With the *key\_method* as a function/method to format the elements before sorting.

**Parameters**

- **key\_method**(*function/method*) – A function or method to use to format the readed element before sorting.
- **reverse** (*bool*) – Tell us if we have to reverse the list.

**Returns** A sorted list.

**Return type** list

**format**()

Return a well formatted list. Basicly, it’s sort a list and remove duplicate.

**Returns** A sorted, without duplicate, list.

**Return type** list

**merge**(*to\_merge*, *strict=True*)

Merge *to\_merge* into the given main list.

**Parameters**

- **to\_merge** (*list*) – The list to merge.
- **strict** (*bool*) – Tell us if we have to respect index (True) or not (False).

**Returns** The merged list.

**Return type** list

## Directory()

**class** PyFunceble.helpers.Directory(*directory*)

Directory manipulation.

**Parameters** **directory** (*str*) – A path to the directory to manipulate.

**fix\_path** (*splited\_path=None*)  
Fix the path of the given path.

**Parameters** `splited_path` (*list*) – A list to convert to the right path.

**Returns** The fixed path.

**Return type** str

## File()

**class** PyFunceble.helpers.File (*file*)  
File treatment/manipulations.

**Parameters** `file` (*str*) – A path to the file to manipulate.

**copy** (*destination*)

Copy the given file to the destination.

**Parameters** `destination` (*str*) – The destination of the copy.

**delete** ()

Delete a given file path.

**read** ()

Read a given file path and return its content.

**Returns** The content of the given file path.

**Return type** str

**write** (*data\_to\_write, overwrite=False*)

Write or append data into the given file path.

**Parameters**

- `data_to_write` (*str*) – The data to write.
- `overwrite` (*bool*) – Tell us if we have to overwrite the content of the file we are working with.

## Hash()

**class** PyFunceble.helpers.Hash (*file\_path=None, algorithm='sha512', only\_hash=False, data=None*)  
Get and return the hash a file with the given algorithm.

**Parameters**

- `file_path` (*str*) – The path to the file we have to hash.
- `algorithm` (*str*) – The algorithm to use.
- `only_hash` – Tell us if we only have to return the desired algorithm instead of the dummy dict format.

---

**Note:** The original version can be found at <https://git.io/vFQrK>.

---

**\_hash\_data** (*algo*)  
Get hash of the given data.

**Parameters** `algo` (`str`) – The algorithm to use.

**\_hash\_file** (`algo`)  
Get the hash of the given file

**Parameters** `algo` (`str`) – The algorithm to use.

**Returns** The hexdigest of the data.

**Return type** `str`

**get()**  
Return the hash of the given file

## 12.2 AdBlock

### 12.2.1 Problematic

How can we efficiently decode AdBlock filter list?

### 12.2.2 Documentation

**class** `PyFunceble.adblock.AdBlock` (`list_from_file`, `aggressive=False`)  
Provide the adblock decoding logic.

**Parameters** `list_from_file` (`list`) – The file in list format.

**classmethod \_extract\_base** (`element`)  
Extract the base of the given element.

**Parameters** `element` (`str/list`) – The element we are working with.

**classmethod \_format\_decoded** (`to_format`, `result=None`)  
Format the extracted adblock line before passing it to the system.

**Parameters**

- **to\_format** (`str`) – The extracted line from the file.
- **result** (`list`) – A list of the result of this method.

**Returns** The list of domains or IP to test.

**Return type** `list`

**\_handle\_options** (`options`)  
Handle the data from the options.

**Parameters** `options` (`list`) – The list of options from the rule.

**Returns** The list of domains to return globally.

**Return type** `list`

**classmethod \_is\_to\_ignore** (`line`)  
Check if we have to ignore the given line.

**Parameters** `line` (`str`) – The line from the file.

**\_remove\_ignored()**  
Removed the ignored element from the given list.

**decode()**

Decode/extract the domains to test from the adblock formated file.

**Returns** The list of domains to test.

**Return type** list

## 12.3 Auto-continue

### 12.3.1 Problematic

How can we continue the test after executable stop?

### 12.3.2 Documentation

**class** PyFunceble.auto\_continue.AutoContinue

Provide the auto-continue subsystem.

**backup()**

Backup the current execution state.

**restore()**

Restore data from the given path.

## 12.4 Auto-save

---

**Note:** Only Travis CI is actually supported.

---

### 12.4.1 Travis CI problematic

How can we bypass the default Travis CI timeout of 45 minutes?

### 12.4.2 Documentation

**class** PyFunceble.auto\_save.AutoScale(is\_last\_domain=False, is\_bypass=False)

Provide the autosave logic.

**Parameters**

- **is\_last\_domain** (bool) – Tell this subsystem if we are at the very end of the file testing.
- **is\_bypass** (bool) – Tell this subsystem if we are in bypassing mode.

**\_travis()**

Logic behind autosave under Travis CI.

**classmethod travis\_permissions()**

Set permissions in order to avoid issues before committing.

## 12.5 Check

### 12.5.1 Problematic

How can we efficiently check the format of IP, domains, and URL?

### 12.5.2 Documentation

**class** PyFunceble.check.Check (*element=None*)

Provide a place to check several things around URL, IP or domain.

**Parameters** **element** (*str*) – The element (URL, IP or domain) to check.

**is\_domain\_valid** (*domain=None*, *subdomain\_check=False*)

Check if the given domain is a valid.

**Parameters**

- **domain** (*str*) – The domain to validate.
- **subdomain\_check** (*bool*) – Activate the subdomain checking.

**Returns** The validity of the sub-domain.

**Return type** bool

**is\_ip\_range** (*ip\_to\_check=None*)

Check if the given IP is a valid IPv4.

**Parameters** **ip\_to\_check** (*str*) – The IP to test.

**Returns** The validity of the IP.

**Return type** bool

**Note:** We only test IPv4 because for now we only them for now.

**is\_ip\_valid** (*ip\_to\_check=None*)

Check if the given IP is a valid IPv4.

**Parameters** **ip\_to\_check** (*str*) – The IP to test.

**Returns** The validity of the IP.

**Return type** bool

**Note:** We only test IPv4 because for now we only them for now.

**is\_subdomain** (*domain=None*)

Check if the given subdomain is a subdomain.

**Parameters** **domain** (*str*) – The domain to validate.

**Returns** The validity of the subdomain.

**Return type** bool

**is\_url\_valid** (*url=None*, *return\_base=False*, *return\_formatted=False*)

Check if the given URL is valid.

### Parameters

- **url** (*str*) – The url to validate.
- **return\_base** – Allow us the return of the url base (if URL formatted correctly).
- **return\_formatted** (*bool*) – Allow us to get the URL converted to IDNA if the conversion is activated.

**Returns** The validity of the URL or its base.

**Return type** bool|str

## 12.6 Cleaning

### 12.6.1 Problematic

How can we clean the `output` / directory so we do not have a collision between old and new files?

### 12.6.2 Documentation

```
class PyFunceble.clean.Clean(list_to_test, clean_all=False)
    Provide the cleaning logic(s).
```

#### Parameters

- **list\_to\_test** (*list/None*) – The list of domains we are testing.
- **clean\_all** (*bool*) – Tell the subsystem if we need to clean all. Which include, of course, the output directory but also all other file(s) generated by our system.

## 12.7 Configuration

### 12.7.1 Problematics

- How can we avoid the usage of `tool.py`?
- How can we make personalization more simple?

### 12.7.2 Documentation

`Load()`

```
class PyFunceble.config.Load(path_to_config)
    Help us load the configuration(s) file(s).
```

**Parameters** `path_to_config` (*str*) – The possible path to the configuration to load.

```
classmethod _install_directory_structure_file()
    Download the latest version of dir_structure_production.json.
```

```
classmethod _install_iana_config()
    Download iana-domains-db.json if not present.
```

**\_install\_production\_config()**

Download the production configuration and install it in the current directory.

**classmethod \_install\_psl\_config()**

Download *public-suffix.json* if not present.

**\_load\_config\_file()**

Load .PyFunceble.yaml into the system.

**classmethod \_set\_path\_to\_configs(path\_to\_config)**

Set the paths to the configuration files.

**Parameters** `path_to_config(str)` – The possible path to the config to load.

**Returns** The path to the config to read (0), the path to the default configuration to read as fall-back.(1)

**Return type** tuple

**Version()****class PyFunceble.config.Version(used=False)**

Compare the local with the upstream version.

**Parameters** `used(bool)` – True: Version is configured for simple usage. False: Version compare local with upstream.

**classmethod check\_versions(local, upstream)**

Compare the given versions.

**Parameters**

- `local(list)` – The local version converted by split\_versions().
- `upstream(list)` – The upstream version converted by split\_versions().

**Returns**

- True: local < upstream
- None: local == upstream
- False: local > upstream

**Return type** bool|None

**classmethod check\_versions\_literally(local, upstream)**

Compare the given versions literally.

**Parameters**

- `local(str)` – The local version converted by split\_versions().
- `upstream(str)` – The upstream version converted by split\_versions().

**Returns**

- True: local == upstream
- False: local != upstream

**Return type** bool

**compare()**

Compare the current version with the upstream saved version.

**classmethod is\_cloned()**

Let us know if we are currently in the cloned version of PyFunceble which implicitly mean that we are in developement mode.

**classmethod right\_url\_from\_version(url)**

Convert the GitHub URL to the right one depending of the branch or version we are working with.

**Parameters** `url (str)` – The URL to convert.

**Returns** The converted URL.

**Return type** str

**classmethod split\_versions(version, return\_non\_digits=False)**

Convert the versions to a shorter one.

**Parameters**

- `version (str)` – The version to split.
- `return_non_digits (bool)` – Activate the return of the non-digits parts of the splitted version.

**Returns** The splitted version name/numbers.

**Return type** list

## 12.8 Core

### 12.8.1 Documentation

**class PyFunceble.core.Core(\*\*args)**

Main entry to PyFunceble. Brain of the program. Also known as “put everything together to make the system works”.

**Parameters**

- `domain_or_ip_to_test (str)` – A domain or IP to test.
- `file_path (str)` – A path to a file to read and test.
- `url_to_test (str)` – A URL to test.
- `url_file (str)` – A path to a file which contains URL to test.
- `link_to_test (str)` – A link to a file to download and test.
- `modulo_test` – If set to True, it will tell the system that we are working as an exported module.
- `modulo_test` – bool

**\_entry\_management()**

Avoid to have 1 millions line into self.\_\_init\_\_()

**\_entry\_management\_url()**

Manage the loading of the url system.

**classmethod \_entry\_management\_url\_download(passed)**

Check if the given information is a URL. If it is the case, it download and update the location of file to test.

**Parameters** `passed (str)` – The url passed to the system.

**Returns** The state of the check.

**Return type** bool

**classmethod \_extract\_domain\_from\_file()**

Extract all non commented lines from the file we are testing.

**Returns** The elements to test.

**Return type** list

**\_file\_decision(current, last, status=None)**

Manage the database, autosave and autocontinue systems for the case that we are reading a file.

**Parameters**

- **current** (str) – The currently tested element.
- **last** (str) – The last element of the list.
- **status** (str) – The status of the currently tested element.

**\_file\_list\_to\_test\_filtering()**

Unify the way we work before testing file contents.

**classmethod \_format\_domain(extracted\_domain)**

Format the extracted domain before passing it to the system.

**Parameters** **extracted\_domain** (str) – The extracted domain.

**Returns** The formatted domain or IP to test.

**Return type** str

**classmethod \_print\_header()**

Decide if we print or not the header.

**classmethod bypass()**

Exit the script if [PyFunceble skip] is matched into the latest commit message.

**classmethod colorify\_logo(home=False)**

Print the colored logo based on global results.

**Parameters** **home** (bool) – Tell us if we have to print the initial coloration.

**domain(domain=None, last\_domain=None)**

Manage the case that we want to test only a domain.

**Parameters**

- **domain** (str) – The domain or IP to test.
- **last\_domain** (str) – The last domain to test if we are testing a file.
- **return\_status** (bool) – Tell us if we need to return the status.

**file()**

Manage the case that need to test each domain of a given file path.

---

**Note:** 1 domain per line.

---

**file\_url()**

Manage the case that we have to test a file

---

**Note:** 1 URL per line.

---

**classmethod reset\_counters()**

Reset the counters when needed.

**classmethod switch(variable, custom=False)**

Switch PyFunceble.CONFIGURATION variables to their opposite.

**Parameters**

- **variable** (*str/bool*) – The variable name to switch. The variable should be an index our configuration system. If we want to switch a bool variable, we should parse it here.
- **custom** (*bool*) – Let us know if have to switch the parsed variable instead of our configuration index.

**Returns** The opposite of the configuration index or the given variable.

**Return type** bool

**Raises**

**Exception** When the configuration is not valid. In other words, if the PyFunceble.CONFIGURATION[variable\_name] is not a bool.

**test(complete=False)**

Avoid confusion between self.domain which is called into \_\_main\_\_ and test() which should be called out of PyFunceble's scope.

**Parameters** **complete** (*bool*) – Activate the return of a dictionary with significant data about the test.

**Returns** ACTIVE INACTIVE or INVALID.

**Return type** str|list

**Raises**

**Exception** When this method is called under \_\_name\_\_ == '\_\_main\_\_'

---

**Note:** This method should never be called in a \_\_name\_\_ == '\_\_main\_\_' context.

---

**url(url\_to\_test=None, last\_url=None)**

Manage the case that we want to test only a given url.

**Parameters**

- **url\_to\_test** (*str*) – The url to test.
- **last\_url** (*str*) – The last url of the file we are testing (if exist)

## 12.9 Database

### 12.9.1 Problematics

- How can we continuously test INACTIVE and INVALID domains or IP?
- How can we reduce the number of whois requests over time?

## 12.9.2 Documentation

```
class PyFunceble.database.Inactive
    Logic behind the generation and the usage of a database system. The main idea behind this is to provide an inactive-db.json and test all inactive domain which are into to it regularly

    _add_to_test(to_add)
        Add an element or a list of element into PyFunceble.CONFIGURATION['inactive_db'][self.file_path]['to_test'].

        Parameters to_add(str/list) – The domain, IP or URL to add.

    _backup()
        Save the current database into the inactive-db.json file.

    _merge()
        Merge the real database with the older one which has already been set into PyFunceble.CONFIGURATION["inactive_db"]

    _reformat_historical_formatting_error()
        Format the old format so it can be merged into the newer format.

    _retrieve()
        Return the current content of the inactive-db.json file.

    _timestamp()
        Get the timestamp where we are going to save our current list.

        Returns The timestamp to append with the currently tested element.

        Return type int|str

    add()
        Save the current :code:`PyFunceble.CONFIGURATION['to_test']` into the current timestamp.

    content()
        Get the content of the database.

        Returns The content of the database.

        Return type list

    remove()
        Remove all occurence of PyFunceble.CONFIGURATION['to_test'] from the database.

    to_test()
        Get the list to test for the next session.

class PyFunceble.database.Whois(expiration_date=None)
    Logic behind the whois database. Indeed, the idea is to implement #2.

    Parameters expiration_date(str) – The extracted expiration date.

    classmethod _authorization()
        Check if we are authorized to work with our database.

    _backup()
        Backup the database into its file.

    _retrieve()
        Retrieve the data from the database.

    add()
        Add the currently tested element into the database.
```

```
get_expiration_date()  
    Get the expiration date from the database.  
  
    Returns The expiration date from the database.  
  
    Return type str|None  
  
is_in_database()  
    Check if the element is into the database.  
  
is_time_older()  
    Check if the current time is older than the one in the database.
```

## 12.10 Directory Structure

### 12.10.1 Problematic

How can we give make the output directory less **annoying** after an update?

### 12.10.2 Documentation

```
class PyFunceble.directory_structure.DirectoryStructure(production=False)  
    Basically a backup/reconstructor of our output directory.
```

**Parameters** `production` (`bool`) – Tell the subsystem if we are preparing for production which imply the execution of the backup instead of the “reconstructore” mode.

```
classmethod _create_directory(directory, loop=False)  
    Creates the given directory if it does not exists.
```

#### Parameters

- `directory` (`str`) – The directory to create.
- `loop` (`bool`) – Tell us if we are in the creation loop or not.

```
_get_structure()  
    Get the structure we are going to work with.
```

**Returns** The structure we have to work with.

**Return type** dict

```
_restore_replace()  
    Check if we need to replace “.gitignore” to “.keep”.
```

**Returns** The replacement status.

**Return type** bool

```
_update_structure_from_config(structure)  
    Update the paths according to configs.
```

**Parameters** `structure` (`dict`) – The read structure.

```
backup()  
    Backup the developer state of output/ in order to make it restorable and portable for user.
```

```
delete_unneeded()  
    Delete the directory which are not registered into our structure.
```

---

```
restore()
    Restore the 'output/' directory structure based on the dir_structure.json file.
```

## 12.11 Execution Time

### 12.11.1 Problematic

How to monitor the execution time of the session?

### 12.11.2 Documentation

```
class PyFunceble.execution_time.ExecutionTime(action='start', last=False)
    Set and return the exection time of the program.
```

#### Parameters

- **action** (*str*) – The action related the execution time. Can be *start* or *stop*.
- **last** (*bool*) – Tell the subsystem if we are at the very end of the file testing.

```
classmethod _authorization()
    Check the execution authorization.
```

**Returns** The authorization status.

**Return type** bool

```
classmethod _calculate(start=None, end=None)
    calculate the difference between starting and ending time.
```

#### Parameters

- **start** (*int / str*) – A starting time.
- **stop** (*int / str*) – A ending time.

#### Returns

A dict with following as index.

- days
- hours
- minutes
- seconds

as index.

**Return type** dict

```
_save(last=False)
```

Save the current time to the file.

**Parameters** **last** (*bool*) – Tell us if we are at the very end of the file testing.

```
classmethod _starting_time()
    Set the starting time.
```

```
classmethod _stoping_time()
    Set the ending time.
```

**format\_execution\_time** (*start=None, end=None*)

Format the calculated time into a human readable format.

**Parameters**

- **start** (*int/str*) – A starting time.
- **stop** (*int/str*) – A ending time.

**Returns** A human readable date.

**Return type** str

## 12.12 Expiration Date

### 12.12.1 Problematic

How can we get the expiration date of a given domain?

### 12.12.2 Documentation

**class** PyFunceble.expiration\_date.ExpirationDate

Get, format and return the expiration date of a domain, if exist.

**\_cases\_management** (*regex\_number, matched\_result*)

A little internal helper of self.format. (Avoiding of nested loops)

---

**Note:** Please note that the second value of the case represent the groups in order [day, month, year].

This means that a [2, 1, 0] will be for example for a date in format 2017-01-02 where 01 is the month.

---

**Parameters**

- **regex\_number** (*int*) – The identifiant of the regex.
- **matched\_result** (*list*) – The matched result to format.

**Returns** A list representing the expiration date. The list can be “decoded” like [day, month, year]

**Return type** list|None

**classmethod \_convert\_1\_to\_2\_digits** (*number*)

Convert 1 digit number to two digits.

**Parameters** **number** (*str/int*) – A number or a digit string.

**Returns** A 2 or more digit string.

**Return type** str

**classmethod \_convert\_or\_shorten\_month** (*data*)

Convert a given month into our unified format.

**Parameters** **data** (*str*) – The month to convert or shorten.

**Returns** The unified month name.

**Return type** str

**\_extract()**

Extract the expiration date from the whois record.

**Returns** The status of the domain.

**Return type** str

**\_format(date\_to\_convert=None)**

Format the expiration date into an unified format (01-jan-1970).

**Parameters** `date_to_convert (str)` – The date to convert. In other words, the extracted date.

**Returns** The formatted expiration date.

**Return type** str

**get()**

Execute the logic behind the meaning of ExpirationDate + return the matched status.

**Returns** The status of the tested domain. Can be one of the official status.

**Return type** str

## 12.13 Generation

### 12.13.1 Problematic

How can we generate files which reflects the results of PyFunceble?

### 12.13.2 Documentation

**class** PyFunceble.generate.**Generate**(*domain\_status*, *source=None*, *expiration\_date=None*)

Generate different sort of files.

**Parameters**

- **domain\_status** (*str*) – The domain status.
- **source** (*str*) – The source of the given status.
- **expiration\_date** (*str*) – The expiration date of the domain (if catched).

**\_analytic\_host\_file\_directory()**

Return the analytic directory to write depending of the matched status.

**classmethod \_handle\_non\_existant\_index()**

Handle and check that some configuration index exists.

**\_prints\_status\_file()**

Logic behind the printing (in file) when generating status file.

**\_prints\_status\_screen()**

Logic behind the printing (on screen) when generating status file.

**\_special\_blogspot()**

Handle the blogspot SPECIAL case.

**\_special\_wordpress\_com()**

Handle the wordpress.com special case.

**analytic\_file(new\_status, old\_status)**

Generate Analytic/\* files based on the given old and new statuses.

**Parameters**

- **new\_status (str)** – The new status of the domain.
- **old\_status (str)** – The old status of the domain.

**down\_status\_file()**

Logic behind the down status when generating the status file.

**info\_files()**

Generate the hosts file, the plain list and the splitted lists.

**invalid\_status\_file()**

Logic behind the invalid status when generating the status file.

**status\_file()**

Generate a file according to the domain status.

**unified\_file()**

Generate unified file. Understand by that that we use an unified table instead of a separate table for each status which could result into a misunderstanding.

**up\_status\_file()**

Logic behind the up status when generating the status file.

**valid\_status\_file()**

Logic behind the valid status when generating the status file.

## 12.14 HTTP Code

### 12.14.1 Problematic

How can we get the HTTP status code of the given domain or IP?

### 12.14.2 Documentation

**class PyFunceble.http\_code.HTTPCode**

Get and return the HTTP code status of a given domain.

**\_access()**

Get the HTTP code status.

**Returns** The matched HTTP status code.

**Return type** int|None

**get()**

Return the HTTP code status.

**Returns** The matched and formatted status code.

**Return type** str|int|None

## 12.15 IANA

### 12.15.1 Problematic

How can we get information from IANA?

### 12.15.2 Documentation

```
class PyFunceble.iana.IANA
    Logic behind the update of iana-domains-db.json

    _extensions (block)
        Extract the extention from the given block. Plus get its referer.

        Parameters block (str) – The line from the IANA database.

        _referer (extension)
            Return the referer for the given extension.

            Parameters extension (str) – A valid domain extension.

            Returns The whois server to use to get the WHOIS record.

            Return type str

    update ()
        Update the content of the iana-domains-db file.
```

## 12.16 Logs

### 12.16.1 Problematic

How can we efficiently generate and share logs?

### 12.16.2 Documentation

```
class PyFunceble.logs.Logs (output=None)
    Provide a clean and unique way to work with logs. Indeed, it's not good to have logs spread around the code :smile:

    Parameters output (str) – A path to the JSON file we are going to write.

    classmethod _get_content (file)
        Get and return the content of the given log file.

        Parameters file (str) – The file we have to get the content from.

        :return The content of the given file. :rtype: dict

    classmethod _write_content (content, file)
        Write the content into the given file.

        Parameters
            • content (dict) – The dict to write.
            • file (str) – The file to write.
```

**expiration\_date** (*extracted*)

Logs the extracted expiration date.

**Parameters** `extracted` (*str*) – The extracted expiration date (from WHOIS record).

**referer\_not\_found** (*extension*)

Logs the case that the referer was not found.

**Parameters** `extension` (*str*) – The extension of the domain we are testing.

**whois** (*record*)

Logs the WHOIS record if needed.

**Parameters** `record` (*str*) – The record to log.

## 12.17 Lookup

### 12.17.1 Problematics

- How can we get information from WHOIS records?
- How can we check if a domain or IP have a valid pointer (nslookup)?

### 12.17.2 Documentation

**class** `PyFunceble.lookup.Lookup`

Can be used to NSLOOKUP or WHOIS lookup.

**classmethod** `nslookup()`

Implementation of UNIX nslookup.

**classmethod** `whois(whois_server, domain=None, timeout=None)`

Implementation of UNIX whois.

**Parameters**

- `whois_server` (*str*) – The WHOIS server to use to get the record.
- `domain` (*str*) – The domain to get the whois record from.
- `timeout` (*int*) – The timeout to apply to the request.

**Returns** The whois record from the given whois server, if exist.

**Return type** `str|None`

## 12.18 Mining

### 12.18.1 Problematic

How can we get the list of domain or URL which link to the desired domain, IPv4 or URL?

## 12.18.2 Documentation

```
class PyFunceble.mining.Mining
    Manage the mining subsystem.

    _add(to_add)
        Add the currently mined information to the mined “database”.

        Parameters to_add(dict) – The element to add.

    _backup()
        Backup the mined informations.

    _retrieve()
        Retrieve the mining informations.

    list_of_minedReturns The list of mined domains or URL.

        Return type list

    mine()
        Search for domain or URL related to the original URL or domain.

        Returns The mined domains or URL.

        Return type dict

    process()
        Process the logic and structuration of the mining database.

    remove()
        Remove the currently tested element from the mining data.
```

## 12.19 Percentage

### 12.19.1 Problematic

How can we calculate the percentage of each status?

### 12.19.2 Documentation

```
class PyFunceble.percentage.Percentage(domain_status=None, init=None)
    Calculation of the percentage of each status.

    Parameters
        • domain_status(str) – The status to increment.

        • init(dict) – The data from a previous session we are continuing.

    classmethod _calculate()
        Calculate the percentage of each status.

    count()
        Count the number of domain for each status.
```

**log()**  
Print on screen and on file the percentages for each status.

## 12.20 Prints

### 12.20.1 Problematic

How can we print information on the screen and on file in a table format?

### 12.20.2 Documentation

**class** PyFunceble.prints.Prints(*to\_print*, *template*, *output\_file=None*, *only\_on\_file=False*)  
Print data on screen and into a file if needed. Template Possibilities: Percentage, Less, HTTP and any status you want.

#### Parameters

- **to\_print** – The list of data to print.
- **template** (*str*) – The template to use.

---

**Note:** Available templates:

- Percentage
- Less
- HTTP
- any of the official status.

- 
- **output\_file** (*str*) – The path to the file to write.
  - **only\_on\_file** (*bool*) – Tell us if we only have to print on file and not on screen.

#### \_before\_header()

Print informations about PyFunceble and the date of generation of a file into a given path, if doesn't exist.

#### \_colorify(*data*)

Retun colored string.

**Parameters** **data** (*str*) – The string to colorify.

**Returns** A colored string.

**Return type** str

#### \_data\_constructor(*size*)

Construct the table of data according to given size.

**Parameters** **size** (*list*) – The maximal length of each string in the table.

**Returns** A dict with all information about the data and how to which what maximal size to print it.

**Return type** OrderedDict

**Raises**

**Exception** If the data and the size does not have the same length.

---

```
classmethod _header_constructor(data_to_print, header_separator='-', col-
umn_separator=' ')
Construct header of the table according to template.
```

**Parameters**

- **data\_to\_print** (*list*) – The list of data to print into the header of the table.
- **header\_separator** (*str*) – The separator to use between the table header and our data.
- **column\_separator** (*str*) – The separator to use between each columns.

**Returns** The data to print in a list format.**Return type** list

```
_json_print()
```

Management of the json template.

```
classmethod _size_from_header(header)
```

Get the size of each columns from the header.

**Parameters** **header** (*dict*) – The header template we have to get the size from.**Returns** The maximal size of the each data to print.**Return type** list

```
data()
```

Management and input of data to the table.

**Raises**

**Exception** When self.data\_to\_print is not a list.

```
header(do_not_print=False)
```

Management and creation of templates of header. Please consider as “header” the title of each columns.

**Parameters** **do\_not\_print** (*bool*) – Tell us if we have to print the header or not.

## 12.21 Production

### 12.21.1 Problematic

How can we efficiently prepare the repository for push/production?

### 12.21.2 Documentation

```
class PyFunceble.production.Production(extern=False)
```

Manage and provide the production preparation logic.

**Parameters** **extern** (*bool*) – Tell us if we do not have to execute the logic automatically. This allow method to be called.

```
classmethod is_dev_version()
```

Check if the current branch is *dev*.

```
classmethod is_master_version()
```

Check if the current branch is *master*.

## 12.22 Public Suffix

### 12.22.1 Problematic

How can we get the list of all possible or at least most used domain suffix?

### 12.22.2 Documentation

```
class PyFunceble.publicsuffix.PublicSuffix(live=True)
```

Let us interact with the public suffix database.

```
    @classmethod _data()
```

Get the database from the public suffix repository.

```
    _extensions(line)
```

Extract the extension from the given line.

**Parameters** `line` (`str`) – The line from the official public suffix repository.

```
    load()
```

Load the public suffix database into the system.

```
    update()
```

Update of the content of the `public-suffix.json`.

## 12.23 Referer

### 12.23.1 Problematic

How can we efficiently get the whois server to call for whois record request?

### 12.23.2 Documentation

```
class PyFunceble.referer.Referer
```

Get the WHOIS server (referer) of the current domain extension according to the IANA database.

```
    @classmethod _iana_database()
```

Convert `iana-domains-db.json` into a dictionary.

**Returns** The content of the database in dictionary format.

**Return type** dict

```
    get()
```

Return the referer aka the WHOIS server of the current domain extension.

## 12.24 Sort

### 12.24.1 Problematic

How can we format the list to test (and the outputted information) in a format other than the alphabetical format?

## 12.24.2 Documentation

**class** PyFunceble.sort.Sort

Provide some sorting presets which we can parse to PyFunceble.helpers.List().custom\_format().

**classmethod hierarchical(element)**

The idea behind this method is to sort a list of domain hierarchically.

**Parameters** element (str) – The element we are currently reading.

**Returns** The formatted element.

**Return type** str

**Note:** For a domain like aaa.bbb.ccc.tdl.

**A normal sorting is done in the following order:**

1. aaa
2. bbb
3. ccc
4. tdl

**This method allow the sorting to be done in the following order:**

1. tdl
2. ccc
3. bbb
4. aaa

**classmethod standard(element)**

Implement the standard and alphabetical sorting.

**Parameters** element (str) – The element we are currently reading.

**Returns** The formatted element.

**Return type** str

## 12.25 Status

### 12.25.1 Problematic

How can we efficiently manage the statuses in function of the test type?

### 12.25.2 Documentation

#### Normal testing

**class** PyFunceble.status.Status (matched\_status, invalid\_source='IANA')

Hanle the research of domain status in case we don't use WHOIS or in case that WHOIS record is not readable nor exploitable.

**Parameters** `matched_result` (`str`) – The previously catched status.

**handle()**

Handle the lack of WHOIS. :smile\_cat:

**Returns** The strus of the domain after generating the files desired by the user.

**Return type** `str`

## URL testing

**class** `PyFunceble.status.URLStatus(catched_status)`

Generate everything around the catched status when testing for URL.

**Parameters** `catched_status` (`str`) – THe catched status.

**handle()**

Handle the backend of the given status.

## Syntax checking

**class** `PyFunceble.status.SyntaxStatus(catched_status)`

Generate everything around the catched status when testing for Syntax.

**Parameters** `catched_status` (`str`) – THe catched status.

**handle()**

Handle the backend of the given status.

# 12.26 Syntax Checking

## 12.26.1 Problematic

How can we check for syntax directly from the CLI?

## 12.26.2 Documentation

**class** `PyFunceble.syntax.Syntax`

Manage everything around the Syntax testing.

**classmethod get()**

Execute the logic behind the Syntax handling.

**Returns** The syntax status.

**Return type** `str`

# 12.27 URL Testing

## 12.27.1 Problematic

How can we test full URL?

## 12.27.2 Documentation

```
class PyFunceble.url.URL
    Manage everything around the URL testing.

    classmethod get()
        Execute the logic behind the URL handling.

        Returns The status of the URL.

        Return type str
```

# CHAPTER 13

---

## Known issues

---

This is the list of issues which are or will not be fixed (yet?).

- Under Travis CI the coloration may not be shown.

# CHAPTER 14

---

## Frequently Asked Questions

---

---

**Note:** Don't want to leave your machine running PyFunceble for days?

Request your list to be tested at [Dead-Hosts!](#)

---

### 14.1 How to speed up a bit the process/test?

For now, we only invite you to disable the usage/request of the WHOIS record.

This action will let the script speed up because we only use the equivalent of nslookup and the HTTP status code to determine the status.

**Warning:** We use/request the WHOIS record in order to avoid a specific false positive case. Indeed, if we disable the usage/request all domains which are still registered but not assigned to a specific IP will be flagged as INACTIVE.

It's not a problem if you keep/use the database system because the domain will be retested over time. But please keep in mind that without the database system we do not guarantee an accurate result.

# CHAPTER 15

---

## Contributing

---

I'm really glad you're reading this because we need contributions to make this tool one of the best tool on the Internet!

### 15.1 Submitting changes

Before anything, please keep in mind the following. If one or more of those conditions are not filled. Your Pull Request to PyFunceble may not be merged.

The master branch is used only for releasing a new or stable version of the code. That's why we require that all contributions/modifications must be done under the dev or a new branch.

In order to gain some time and also understand what you are working on, your pull requests submission as long as your commit descriptions should be clear and complete as much as possible. We do an exception to commit with minor changed but big changes should have a complete description. Please ensure to use the following method when committing a big change.

#### 15.1.1 Steps before commit

---

**Note:** The following do not apply if you do not touch the PyFunceble nor the tests directory.

---

```
$ # We format our code.  
$ black PyFunceble && black tests/*.py  
$ # We lint our code. Please make sure to fix all reported issues.  
$ pylint PyFunceble && pylint tests/*.py  
$ # We check the tests coverage. Please ensure that at lease 95% of the code is _  
→covered.  
$ coverage run setup.py test && coverage report -m  
$ # Prepare our files, :code:`version.yaml` and code for pushing.  
$ PyFunceble --production
```

### 15.1.2 The commit

```
$ # There paragraph is optional if your changes/commits are obvious.  
$ git commit -S -m "A summary of the commit" -m "A paragraph  
> or a sentence explaining what changed, why and its impact."
```

All your commits should be signed with **PGP**. (More information can be found on [GitHub documentation](#))

Please note the usage of `-S` into the `commit` command which means that we sign the commit. The usage of `PyFunceble --production update version.yaml` and `directory_structure_production.json` automatically.

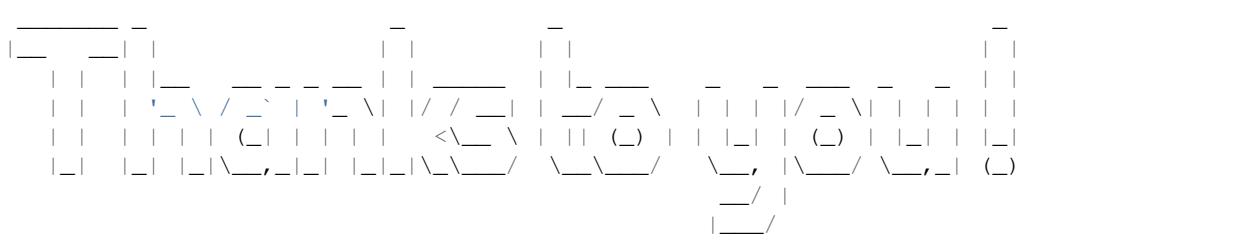

## 15.2 Coding conventions

- We make sure that a method, a function, and a class **have doctrings**.
- One line should not exceed 79 characters for docstring and 100 characters for long declaration/assignment. - Exception granted for regular expressions or long string assignment.
- We use [Black](#), *The uncompromising Python code formatter*, to format our code.
- Our code should pass `pylint PyFunceble && pylint tests/*.py` with at least a score of 10.00/10.00
- We do not forget to follow the steps before any commits.

# CHAPTER 16

## Contributors

Thanks to those awesome peoples for their awesome and crazy idea(s), contribution(s) and or issue report which made or make [PyFunceble](#) a better tool.

# CHAPTER 21

---

## Code of Conduct

---

### 21.1 Our Pledge

In the interest of fostering an open and welcoming environment, we as contributors and maintainers pledge to making participation in our project and our community a harassment-free experience for everyone, regardless of age, body size, disability, ethnicity, gender identity and expression, level of experience, nationality, personal appearance, race, religion, or sexual identity and orientation.

### 21.2 Our Standards

Examples of behavior that contributes to creating a positive environment include:

- Using welcoming and inclusive language
- Being respectful of differing viewpoints and experiences
- Gracefully accepting constructive criticism
- Focusing on what is best for the community
- Showing empathy towards other community members

Examples of unacceptable behavior by participants include:

- The use of sexualized language or imagery and unwelcome sexual attention or advances
- Trolling, insulting/derogatory comments, and personal or political attacks
- Public or private harassment
- Publishing others' private information, such as a physical or electronic address, without explicit permission
- Other conduct which could reasonably be considered inappropriate in a professional setting

## 21.3 Our Responsibilities

Project maintainers are responsible for clarifying the standards of acceptable behavior and are expected to take appropriate and fair corrective action in response to any instances of unacceptable behavior.

Project maintainers have the right and responsibility to remove, edit, or reject comments, commits, code, wiki edits, issues, and other contributions that are not aligned to this Code of Conduct, or to ban temporarily or permanently any contributor for other behaviors that they deem inappropriate, threatening, offensive, or harmful.

## 21.4 Scope

This Code of Conduct applies both within project spaces and in public spaces when an individual is representing the project or its community. Examples of representing a project or community include using an official project e-mail address, posting via an official social media account, or acting as an appointed representative at an online or offline event. Representation of a project may be further defined and clarified by project maintainers.

## 21.5 Enforcement

Instances of abusive, harassing, or otherwise unacceptable behavior may be reported by contacting the project team at [contact@funilrys.com](mailto:contact@funilrys.com). The project team will review and investigate all complaints, and will respond in a way that it deems appropriate to the circumstances. The project team is obligated to maintain confidentiality with regard to the reporter of an incident. Further details of specific enforcement policies may be posted separately.

Project maintainers who do not follow or enforce the Code of Conduct in good faith may face temporary or permanent repercussions as determined by other members of the project's leadership.

## 21.6 Attribution

This Code of Conduct is adapted from the [Contributor Covenant](#), version 1.4, available at <http://contributor-covenant.org/version/1/4>.

## CHAPTER 22

---

Discovered any issue?

---

Want to make it public? Then fill a [new issue](#).

Want to talk with [@funilrys](#) about it? Then stay in touch with [Fun Ilrys on Keybase](#) (preferred) or send an email to contactTATATAfunilrysTODTOTODcom.

Don't want to fill an issue on GitHub? You can still inform us about it on our [issues team](#) on Keybase.
